

13 June 2023

YIN EXTENDED BY ~1KM & ~2.5KM OF HIGH-GRADE NdPr DISCOVERIES - MANGAROON (100%)

HIGHLIGHTS

- First batch of assays (~1,500 samples) received for 2023 which include extensions to the 3km long Yin JORC 2012 Inferred Mineral Resource ("Resource") and first pass drilling testing the Exploration Target of 50-100Mt at 0.9-1.3% TREO over ~40kms (ASX 13 Feb 2023). Significant intercepts extending the Yin Resource by ~1km include:
 - YINRC141: 20m @ 2.15% TREO, 4.9 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (23% NdPr:TREO) from 67m,
 - including 8m @ 4.85% TREO, 11.5 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (24% NdPr:TREO) from 68m
 - YINRC137: 9m @ 2.15% TREO, 5.7 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (26% NdPr:TREO) from 36m,
 - including 3m @ 5.80% TREO, 15.6 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (27% NdPr:TREO) from 37m
 - YINRC179: 10m @ 1.33% TREO, 3.2 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (24% NdPr:TREO) from 119m,
 - including 4m @ 2.15% TREO, 5.2 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (24% NdPr:TREO) from 120m
 - And 26m @ 1.22% TREO, 2.7 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (22% NdPr:TREO) from 140m
 - including 8m @ 2.10% TREO, 4.7 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (23% NdPr:TREO) from 140m

First pass, wide spaced drilling along the Exploration Target has confirmed three ironstone discoveries (combined length of ~2.5kms) with the highest NdPr:TREO ratios reported to date, up to 46%. Significant intercepts include:

- YINRC172: 22m @ 2.01% TREO, 7.7 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (38% NdPr:TREO) from surface,
 - including 12m @ 3.10% TREO, 12.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (39% NdPr:TREO) from 6m
- YINRC173: 15m @ 1.31% TREO, 4.5 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (34% NdPr:TREO) from 61m,
 - including 7m @ 2.23% TREO, 7.8 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (35% NdPr:TREO) from 68m
- YINRC152: 17m @ 0.85% TREO, 3.4 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (40% NdPr:TREO) from 20m,
 - including 2m @ 3.12% TREO, 13.4 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (43% NdPr:TREO) from 34m
- And 5m @ 1.35 TREO, 6.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (45% NdPr:TREO) from 58m
 - including 2m @ 2.40% TREO, 11.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (46% NdPr:TREO) from 60m
- First pass, wide spaced drilling continues across the Yin ironstones and the C1-C7 Carbonatites with infill Resource drilling to commence in June 2023. With over 6,000 samples now progressing through the lab, results are expected to flow on an ongoing basis.
- Yin ironstone Resource updates remain on schedule for June/July 2023 and the December 2023 quarter.

Dreadnought Resources Limited ("Dreadnought") is pleased to provide an update on drilling activities at Yin, part of the 100% owned Mangaroon project, located in the Gascoyne Region of Western Australia.

Assays have confirmed thick mineralisation extends ~1km south from the initial 3km long Yin Resource. Encouragingly, results from first pass, wide spaced drilling have confirmed three additional ironstones at Y2 and north of the Yin Resource which have produced the highest NdPr:TREO ratios identified to date. These new ironstones and the Yin extensions will underpin Resource upgrades in the December 2023 quarter including a significant Indicated Resource component to support an initial Scoping Study.

Dreadnought's Managing Director, Dean Tuck, commented: "The dam has finally burst on assays with steady news flow now ongoing through 2023. Highlights include: the highest NdPr:TREO ratios seen to date from three new discoveries with a combined ~2.5km strike length; Yin extended ~1km to the south; and high grades from surface at Y2 where a Resource will be delivered. We look forward to expanding the Resource base with significant news flow throughout 2023."

SNAPSHOT - MANGAROON RARE EARTHS

Mangaroon is 100% Owned by Dreadnought

Genuine Scale Potential Already at Yin Ironstone Complex

- Initial independent Yin Inferred Resource of 14.36Mt @ 1.13% TREO (ASX 28 Dec 2022) covers only 3km of 43km of strike and is based on only 2.5 months of RC drilling (12,255m).
- 40km long Exploration Target of 50-100Mt at 0.9-1.3% TREO estimated for the top 150m of the Yin Ironstone Complex (ASX 13 Feb 2023).
- Resource extension and first pass wide spaced drilling currently underway.

Significant, Step-Change, Growth Potential Beyond Yin Ironstone Complex

- C1-C7 carbonatites are shaping up as the regional source of REE – initial drill program expands C1-C5 to ~6.5kms in strike length x 1km wide.
- C6 located ~25kms south of C1-5 and C7 is: situated over a crustal scale structural splay off the Lyons River Fault; associated with an outcropping pyroxenite intrusion; and geophysically similar to globally significant carbonatites such as Mt Weld, Araxa, Palabora and Ngualla.
- First pass, wide spaced discovery focused drilling is ongoing at C1-C7.

High-grade, Multi-Metal Potential Including REE (Neodymium, Praseodymium), Phosphorus, Niobium, Titanium & Scandium (REE-P₂O₅-Nb₂O₅-TiO₂-Sc)

- The mineralisation at the Yin Ironstone Complex contains significantly higher NdPr as a fraction of the rare earth oxides (“NdPr:TREO” ratio) than most other REE deposits globally, over 50% higher than the global average.
- Partially completed, first pass, wide spaced drilling over the C1-C7 carbonatites has identified significant critical metal potential with REE, P₂O₅, Nb₂O₅, TiO₂ and Sc within the C1-C5 carbonatites.
- A ~600m x 550m zone of REE-P₂O₅-Nb₂O₅-TiO₂-Sc mineralisation has been confirmed at the C3 discovery.

Potentially Attractive Mining Proposition

- Broad zones of flat to moderate dipping mineralisation with parallel lodes and Resource intensity of ~4.8Mt/km make for a potentially attractive mining proposition.

Positive Metallurgy Results

- Metallurgical test work from Yin has performed well, achieving recoveries ranging from 85.9% to 92.8% at a concentrate grade of 10.76% to 15.31% Nd₂O₃+Pr₆O₁₁.
- REE at Yin is predominantly hosted in monazite which is amenable to commercial processing.
- Significant metallurgical studies ongoing – results expected throughout 2023.

Global Strategic Imperative Driving Rare Earth Growth & Prices

- Supply chain security and low carbon transition are imperatives against a backdrop of heightened geopolitical tension.
- Dreadnought is receiving increasing levels of interest from mid/downstream industry participants. While the current focus is on upstream options (mining, milling and concentrating) opportunities for mid/downstream industry participants to add value to Dreadnought shareholders will be assessed.

Figure 1: Plan view of Yin over an orthoimage showing the location of holes over the current 3km long Resource (black dots), holes for which assays have been received (red dots), pending assays (blue dots) and planned holes (white dots). The three discoveries (red lines) and cross-sections along the Exploration Target (yellow dashed lines) are also shown.

RC Drill Program Yin Ironstone Complex (YINRC130-YINRC268, Y3RC039-Y3RC048)

So far in 2023, 149 RC holes for 18,809m and 10 diamond holes for 1,200m have been drilled testing portions of the 40km long ironstone Exploration Target and extending the Yin Resource to the south. As a result of the success of this program, infill RC drilling is planned in order to upgrade the Resources at Y2 and Yin.

Yin Resource Extensions: The current program is over areas that are largely devoid of outcrop and has relied on geophysical interpretations of the ironstone trends undercover. The program has been successful in extending mineralisation undercover to the south of the 3km long Yin Resource by ~1km with significant results including:

- **YINRC141: 20m @ 2.15% TREO, 4.9 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (23% NdPr:TREO) from 67m,**
- **including 8m @ 4.85% TREO, 11.5 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (24% NdPr:TREO) from 68m**

Two High-Grade NdPr Discoveries: In addition, wide spaced (400m x 40m) drilling has identified two new ironstone lodes (over ~2kms) to the north of the Yin Resource. Importantly, these lodes contain the highest NdPr:TREO ratios seen to date including:

- **YINRC152: 17m @ 0.85% TREO, 3.4 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (40% NdPr:TREO) from 20m,**
- **including 2m @ 3.12% TREO, 13.4 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (43% NdPr:TREO) from 34m**
- **And 5m @ 1.35% TREO, 6.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (45% NdPr:TREO) from 58m**
- **including 2m @ 2.40% TREO, 11.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (46% NdPr:TREO) from 60m**

Y2 Discovery: Additionally, the shallowly dipping Y2 ironstone, located ~1km Northwest of the Yin Resource, is expected to grow into a high-grade NdPr Resource with significant intercepts including:

- **YINRC172: 22m @ 2.01% TREO, 7.7 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (38% NdPr:TREO) from surface,**
- **including 12m @ 3.10% TREO, 12.0 kg/t of $\text{Nd}_2\text{O}_3+\text{Pr}_6\text{O}_{11}$ (39% NdPr:TREO) from 6m**

Drilling of the ironstones continues to show that the main lodes pinch, swell and change dip, potentially plunge and orientation along strike and range in thickness from 1-54m. In addition, parallel lodes have been intersected above and below the main lodes and often exhibit a similar orientation as the main lodes with thicknesses ranging from 1-10m.

The mineralised ironstones consist of goethite and hematite dominated oxide zones near the surface (top ~60-120m) transitioning into a fresh ferrocarnatite dyke (fresh REE ironstone), comprised of ankerite and siderite below the base of oxidation. The ironstones are surrounded by a variable zone of fenitised country rock with the fenitised zone often including thin ironstone veins.

Both the ironstone and the fenite immediately surrounding the ironstone are mineralised with each ironstone and ferrocarnatite containing at least one central interval of higher-grade mineralisation. Oxidised mineralisation contains REE bearing phosphate monazite-Ce and monazite-Nd, variable amounts of the hydrated REE phosphate rhabdophane and trace amounts of apatite which occasionally carries small amounts of rare earths. Fresh ferrocarnatite mineralisation contains monazite and variable amounts of apatite and REE fluoro-carbonates such as bastnaesite.

First pass, 400m x 40m wide spaced drilling along 16kms of the Yin Exploration Target will be completed in June 2023 at which time infill Resource drilling will commence.

Figure 2: Cross section A-A' showing the shallowly dipping 5-22m thick Y2 lode horizon mineralised from surface.

Figure 3: Cross section A-A' showing part of the extension to the wide main lode horizon at Yin with ~80m of oxidation and moderately dipping to the east and remaining open at depth.

Technical Discussion on Exploration Target Drill Program

The outcropping REE ironstones have a distinctive radiometric signature and appear as gossanous iron rich outcrops in ortho-imagery. From June to September 2021, Dreadnought announced the identification of the Yin ironstones using wide spaced 1990s government radiometric data and modern ortho-imagery.

During 2022, Dreadnought identified 43km of mineralised ironstones at Yin as well as the REE-P₂O₅-Nb₂O₅-TiO₂-Sc C1-C7 carbonatites.

In December 2022, Dreadnought defined an Inferred Resource of 14.36Mt @ 1.13% TREO (ASX 28 Dec 2022) over only 3km of the 43km of mineralised ironstones.

With only 7% of the 43kms of ironstones drilled to date, there remains significant potential to add to the initial Resource at Yin. In addition, a 40km long Exploration Target of 50-100Mt at 0.9-1.3% TREO was estimated for the top 150m of Yin (ASX 13 Feb 2023).

The 2023 ironstone drilling program aims to grow the initial Resource by converting portions of the Exploration Target to Resource.

Figure 4: Plan view of the recently completed ~3kms of Exploration Target drilling (red dots – assays received, blue dots – assay pending), 16kms of planned Exploration Target drilling (white dots) over an ortho-image. This drilling is expected to both extend the current Resource and to convert portions of the Exploration Target to Resource. Infill drilling is also shown (white dots).

RC Drill Program REE-P-Nb-Ti-Sc Carbonatites (CRBRC090-CRBRC127)

Carbonatite intrusions are known globally to host several different commodities including rare earths, niobium, titanium, phosphate and scandium often as different mineralised bodies within the same intrusion. Great examples of this include Mt Weld in Australia, Ngualla in Tanzania, Bayan Obo in China, Palabora in South Africa and Araxa in Brazil. We also know that a world class deposit like Mountain Pass in California can fit into a relatively small footprint (700m x 150m).

Since the C1-C7 carbonatites have minimal outcrop, a first-pass RC drilling program (~280 RC holes for ~20,000m) has been designed, of which 87 holes for 8,332m have been drilled, on a ~160m x 160m grid to drill through cover and into fresh rock. The objective of this program is to confirm the extent and complexity of the interpreted carbonatite intrusions, define zones of mineralisation and to better understand the cover regolith and depth of weathering.

Drilling to date has confirmed the C1-5 carbonatites are larger than initially interpreted from magnetic data with systematic, wide spaced drilling underway. The C5 extensional drilling has intersected thin cover and thick saprolite development with residual supergene enrichment overlying magnesio to ferrocarbonatite intrusives, similar to that previously seen at C1-C5. Drilling has already confirmed the C5 carbonatite extends >800m past the original interpretation and remains open to the southeast.

Wide spaced, first pass RC drilling is ongoing over the C1-C7 carbonatites and is expected to be completed in July 2023.

Figure 5: Plan view over Mangaroon showing location of the 43kms of REE ironstones and the C1-C7 carbonatites.

Background on Mangaroon (E8/3178, E08/3274, E09/2384, E09/2433, E09/2473: FQM Earn-in) (E08/3275, E08/3439, E09/2290, E09/2359, E09/2405, E09/2370, E09/2448, E09/2449, E09/2450, E09/2467, E09/2478, E09/2531, E09/2535, E09/2616, E09/2620, M09/146, M09/147, M09/174, M09/175: DRE 100%)

Mangaroon covers >5,300sq kms of the Mangaroon Zone in the Gascoyne Region of Western Australia. Part of the project is targeting Ni-Cu-PGE and is subject to First Quantum Minerals Ltd (“FQM”) earning up to 70% (Figure 6). The region is also host to high-grade gold mineralisation at the Bangemall/Cobra and Star of Mangaroon gold mining centres and the high NdPr:TREO ratio Yin and Yangibana REE deposits.

Dreadnought has located outcropping high-grade gold bearing quartz veins along the Star of Mangaroon Shear, Edmund and Minga Bar Faults, high-grade REE ironstones, similar to those under development at Yangibana, REE-P₂O₅-Nb₂O₅-TiO₂-Sc mineralised carbonatites and outcropping high tenor Ni-Cu-PGE blebby sulphides at the Money Intrusion.

Dreadnought has already successfully delivered:

- an initial independent JORC Inferred Resource of 14.36Mt @ 1.13% TREO (ASX 28 Dec 2022) covering only 3kms of the 43kms of strike within the Yin Ironstone Complex; and
- an Exploration Target of 50-100Mt at 0.9-1.3% TREO (ASX 13 Feb 2023) estimated over the remaining 40 kms of strike within the Yin Ironstone Complex.

Figure 6: Plan view map of Mangaroon showing the location of gold, nickel and REE prospects in relation to major structures, geology and roads.

UPCOMING NEWSFLOW

June-December: Ongoing drilling results from Mangaroon REE (100%)

21-22 June: Gold Coast Investment Showcase

June: FLEM results from Thunderer and Orion (Tarraji 80%, Yampi 100%)

June/July: REE Resource upgrade (Mangaroon 100%)

June/July: Results of nickel review with Newexco (Central Yilgarn 100%)

July: Commencement of RC drilling at the Money Intrusion (Mangaroon First Quantum Earn-in)

July: Quarterly Activities and Cashflow Report

19-21 July: Noosa Mining Investor Conference

August: Commencement of RC drilling at Mangaroon Au (100%)

7-9 August: Diggers and Dealers Conference

September: Drilling and DHEM results from Money Intrusion (Mangaroon First Quantum Earn-in)

September: Commencement of drilling at Tarraji-Yampi (80% and 100%)

November: Follow-up RC drilling at Mangaroon Au (100%)

December 2023 quarter: REE Resource upgrade (Mangaroon 100%)

~Ends~

This announcement is authorised for release to the ASX by the Board of Dreadnought.

INVESTMENT HIGHLIGHTS

Kimberley Ni-Cu-Au Projects

Dreadnought controls the second largest land holding in the highly prospective West Kimberley region of WA. The main project area, Tarraji-Yampi, is located only 85kms from Derby and has been locked up as a Defence Reserve since 1978.

Tarraji-Yampi presents a rare first mover opportunity with known outcropping mineralisation and historic workings from the early 1900's which have seen no modern exploration.

Results to date indicate that there may be a related, large scale, Proterozoic Cu-Au-Ag-Bi-Sb-Co system at Tarraji-Yampi, similar to Cloncurry / Mt Isa in Queensland and Tennant Creek in the Northern Territory.

Mangaroon Ni-Cu-PGE JV & REE Au 100% Project

Mangaroon is a first mover opportunity covering ~5,300 kms located 250kms south-east of Exmouth in the vastly underexplored Gascoyne Region of WA. Part of the project is targeting Ni-Cu-PGE and is subject to a joint venture with First Quantum Minerals (earning up to 70%). The joint venture area contains outcropping high tenor Ni-Cu-PGE blebby sulphides at the Money Intrusion. Dreadnought's 100% owned areas contain outcropping high-grade gold bearing quartz veins including the historic Star of Mangaroon and Diamond's gold mines, along the Edmund and Minga Bar Faults and outcropping high-grade REE ironstones and seven carbonatite intrusions which may be the source of the regions rare earth mineralisation.

Dreadnought's 100% owned areas contain outcropping high-grade gold bearing quartz veins including the historic Star of Mangaroon and Diamond's gold mines, along the Edmund and Minga Bar Faults and outcropping high-grade REE ironstones and seven carbonatite intrusions which may be the source of the regions rare earth mineralisation.

Dreadnought has delivered an initial JORC Inferred Resource over just 3kms Yin REE Ironstone Complex delivering 14.36Mt @ 1.13% TREO (30% NdPr:TREO Ratio) (ASX 28 Dec 2022) with an additional 40 strike kilometres still to be tested.

Bresnahan HREE and Au Project

Bresnahan is located ~125km southwest of Newman in the Ashburton Basin. The project comprises ~3,700 sq kms covering over 200kms strike along the Bresnahan Basin / Wyloo Group unconformity. Bresnahan is prospective for unconformity related heavy rare earth ("HREE") deposits similar to Browns Range HREE deposits and mesothermal lode gold similar to Paulsen's Au-Ag-Sb deposits along strike.

Prior to consolidation by Dreadnought, the Bresnahan Basin had only been explored for unconformity uranium with limited exploration for mesothermal gold. Bresnahan is a first mover opportunity to explore for unconformity HREE.

Central Yilgarn Gold, Base Metals, Critical Minerals & Iron Ore Project

Central Yilgarn is located ~190km northwest of Kalgoorlie in the Yilgarn Craton. The project comprises ~1,600 sq kms covering ~150km of strike along the majority of the Illara, Yerilgee and Evanston greenstone belts. Central Yilgarn is prospective for typical Archean mesothermal lode gold deposits, VMS base metals, komatiite hosted nickel sulphides and critical metals including Lithium-Caesium-Tantalum.

Prior to consolidation by Dreadnought, the Central Yilgarn was predominantly held by iron ore explorers and remains highly prospective for iron ore.

Cautionary Statement

This announcement and information, opinions or conclusions expressed in the course of this announcement contains forecasts and forward-looking information. Such forecasts, projections and information are not a guarantee of future performance, involve unknown risks and uncertainties. Actual results and developments will almost certainly differ materially from those expressed or implied. There are a number of risks, both specific to Dreadnought, and of a general nature which may affect the future operating and financial performance of Dreadnought, and the value of an investment in Dreadnought including and not limited to title risk, renewal risk, economic conditions, stock market fluctuations, commodity demand and price movements, timing of access to infrastructure, timing of environmental approvals, regulatory risks, operational risks, reliance on key personnel, reserve estimations, native title risks, cultural heritage risks, foreign currency fluctuations, and mining development, construction and commissioning risk.

Competent Person's Statement – Exploration Results

The information in this announcement that relates to geology, Exploration Results and Exploration Targets was compiled by Mr. Dean Tuck, who is a Member of the AIG, Managing Director, and shareholder of the Company. Mr. Tuck has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Tuck consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information in the original reports, and that the form and context in which the Competent Person's findings are presented have not been materially modified from the original reports.

Competent Person's Statement – Mineral Resources

The information in this announcement that relates to Mineral Resources is based on information compiled by Mr Lynn Widenbar, a Competent Person who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Widenbar is a full-time employee of Widenbar and Associates Pty Ltd. Mr Widenbar has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves'. Mr Widenbar consents to the inclusion in the announcement of the matters based on his information in the form and context that the information appears.

JORC CODE, 2012 EDITION – TABLE 1 REPORT TEMPLATE

SECTION 1 SAMPLING TECHNIQUES AND DATA

(CRITERIA IN THIS SECTION APPLY TO ALL SUCCEEDING SECTIONS.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	- Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Reverse Circulation (RC) drilling was undertaken to produce samples for assaying. Laboratory Analysis A pXRF is used on site to determine mineralised samples. Mineralised intervals have the 1m split collected, while unmineralised samples are not sampled. Samples submitted to the laboratory were determined by the site geologist with the assistance of the pXRF. 1m Splits From every metre drilled a 2-3kg sample (split) was sub-sampled into a calico bag via a Metzke cone splitter from each metre of drilling. All samples are submitted to ALS Laboratories in Perth for determination of Rare Earth Oxides and additional elements by Lithium Borate Fusion XRF (ALS Method ME-XRF30). Some samples are also submitted for 48 multi-elements via 4 acid digestion with MS/ICP finish (ALS Code ME-MS61) to assist with lithological interpretation and waste rock characterisation.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	RC Drilling Ausdrill undertook the program utilising a Drill Rigs Australia truck mounted Schramm T685WS drill rig with additional air from an auxiliary compressor and booster. Bit size was 5¾".
Drill sample recovery	- Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative nature of the samples. - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	RC Drilling Drilling was undertaken using a 'best practice' approach to achieve maximum sample recovery and quality through the mineralised zones. Best practice sampling procedure included: suitable usage of dust suppression, suitable shroud, lifting off bottom between each metre, cleaning of sampling equipment, ensuring a dry sample and suitable supervision by the supervising geologist to ensure good sample quality. At this stage, no known bias occurs between sample recovery and grade.
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative	RC chips were logged under the supervision of a qualified geologist with sufficient experience in this geological terrane and relevant styles of mineralisation using an industry standard logging system which could eventually be utilised within a

Criteria	JORC Code explanation	Commentary
	<i>in nature. Core (or costean, channel, etc.) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	Mineral Resource Estimation. Lithology, mineralisation, alteration, veining, weathering and structure were all recorded digitally. Chips were washed each metre and stored in chip trays for preservation and future reference. RC pulp material is also analysed on the rig by pXRF, scintillometer and magnetic susceptibility meter to assist with logging and the identification of mineralisation. Logging is qualitative, quantitative or semi-quantitative in nature.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	RC Drilling From every metre drilled, a 2-3kg sample (split) was sub-sampled into a calico bag via a Metzke cone splitter. QAQC in the form of duplicates and CRM's (OREAS Standards) were inserted through the ore zones at a rate of 1:50 samples. Additionally, within mineralised zones, a duplicate sample was taken and a blank inserted directly after. 2-3kg samples are submitted to ALS laboratories (Perth), oven dried to 105°C and pulverised to 85% passing 75um to produce a 0.66g charge for determination of Rare Earth Oxides by Lithium Borate Fusion XRF (ALS Method ME-XRF30) and to produce a 0.25g charge for determination of 48 multi-elements via 4 acid digestion with MS/ICP finish (ALS Code ME-MS61). Standard laboratory QAQC is undertaken and monitored.
Quality of assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	Laboratory Analysis Lithium borate fusion is considered a total digest and Method ME-XRF30 is appropriate for REE determination. Standard laboratory QAQC is undertaken and monitored by the laboratory and by the company upon assay result receipt.
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i>	Logging and Sampling Logging and sampling were recorded directly into a digital logging system, verified and eventually stored in an offsite database. Significant intersections are inspected by senior company personnel. No twinned holes have been reported at this time. No adjustments to any assay data have been

Criteria	JORC Code explanation	Commentary
		undertaken.
Location of data points	- Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. - Specification of the grid system used. - Quality and adequacy of topographic control.	Collar position was recorded using a Emlid Reach RS2 RTK GPS system (+/- 0.2m x/y, +/-0.5m z). GDA94 Z50s is the grid format for all xyz data reported. Azimuth and dip of the drill hole was recorded after the completion of the hole using a Reflex Sprint IQ Gyro. A reading was undertaken every 30th metre with an accuracy of +/- 1° azimuth and +/-0.3° dip.
Data spacing and distribution	- Data spacing for reporting of Exploration Results. - Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. - Whether sample compositing has been applied.	See tables for hole positions and sampling information. Data spacing and distribution is sufficient to establish the degree of geological and grade continuity for a Mineral Resource estimation procedure at the inferred classification.
Orientation of data in relation to geological structure	- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	Drilling was undertaken at a near perpendicular angle to the interpreted strike and dip of the ironstone outcrops and modelled magnetic data. No sample bias is known at this time.
Sample security	The measures taken to ensure sample security.	All geochemical samples were collected, bagged, and sealed by Dreadnought staff and delivered to Exmouth Haulage in Exmouth. Samples were delivered directly to ALS Laboratories Perth by Exmouth Haulage out of Exmouth.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	The program is continuously reviewed by senior company personnel.

SECTION 2 REPORTING OF EXPLORATION RESULTS

(CRITERIA IN THIS SECTION APPLY TO ALL SUCCEEDING SECTIONS.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	- The Mangaroon Project consists of 20 granted Exploration License (E08/3178, E08/3274, E08/3275, E08/3439, E09/2290, E09/2359, E09/2370, E09/2384, E09/2405, E09/2433, E09/2448, E09/2449, E09/2450, E09/2467, E09/2473, E09/2478, E09/2531, E09/2535, E09/2616, E09/2620) and 4 granted Mining Licenses (M09/146, M09/147, M09/174, M09/175). - All tenements are 100% owned by Dreadnought Resources. - E08/3178, E08/3274, E09/2384, E09/2433, E09/2473 are subject to an option agreement

Criteria	JORC Code explanation	Commentary
		with First Quantum Minerals over the base metal rights. - E08/3178, E09/2370, E09/2384 and E09/2433 are subject to a 2% Gross Revenue Royalty held by Beau Resources. - E08/3274, E08/3275, E09/2433, E09/2448, E09/2449, E09/2450 are subject to a 1% Gross Revenue Royalty held by Beau Resources. - E09/2359 is subject to a 1% Gross Revenue Royalty held by Prager Pty Ltd. - E09/2290, M09/146 and M09/147 are subject to a 1% Gross Revenue Royalty held by STEHN, Anthony Paterson and BROWN, Michael John Barry.² - M09/174 is subject to a 0.5% Gross Revenue Royalty held by STEHN, Anthony Paterson. - M09/175 is subject to a 0.5% Gross Revenue Royalty held by STEHN, Anthony Paterson and BROWN, Michael John Barry. - The Mangaroon Project covers 4 Native Title Determinations including the Budina (WAD131/2004), Thudgari (WAD6212/1998), Gnulli Gnulli (WAD22/2019) and the Combined Thiin-Mah, Warriyangka, Tharrkari and Jiwarli (WAD464/2016). - The Mangaroon Project is located over Lyndon, Edmund, Mangaroon, Gifford Creek, Maroonah, Minnie Creek, and Towera Stations.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Historical exploration of a sufficiently high standard was carried out by a few parties which have been outlined and detailed in this ASX announcement including: Regional Resources 1986-1988s: WAMEX Reports A23715, 23713 Peter Cullen 1986: WAMEX Report A36494 Carpentaria Exploration Company 1980: WAMEX Report A9332 Newmont 1991: WAMEX Report A32886 Hallmark Gold 1996: WAMEX Report A49576 Rodney Drage 2011: WAMEX Report A94155 Sandfire Resources 2005-2012: WAMEX Report 94826
Geology	Deposit type, geological setting and style of mineralisation.	The Mangaroon Project is located within Mangaroon Zone of the Gascoyne Province. The Mangaroon Project is prospective for orogenic gold, magmatic Ni-Cu-PGE mineralisation and carbonatite hosted REEs.
Drill hole information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - easting and northing of the drill hole	An overview of the drilling program is given within the text and tables 1 and 2 within this document.

Criteria	JORC Code explanation	Commentary
	- collar - elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - dip and azimuth of the hole - down hole length and interception depth - hole length. - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated.	All result greater than 0.3% TREO have been reported. Significant intercepts are length weight averaged for all samples with TREO values >0.2% TREO with up to 3m of internal dilution (<0.2% TREO). No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	Drilling is undertaken close to perpendicular to the dip and strike of the mineralisation.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to figures within this report.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	The accompanying document is a balanced report with a suitable cautionary note.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density,	Suitable commentary of the geology encountered are given within the text of this document.

Criteria	JORC Code explanation	Commentary
	<i>groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	
<i>Further work</i>	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Additional RC drilling Diamond drilling Metallurgical test work Additional Resource Modelling
