

ASX Announcement

31 July 2024

Quarterly activities report

April – June 2024

For personal use only

Financially strong with \$2.0M cash at end of quarter and no debt

- Sale of ASX:TMG shares during the quarter bolstered BOA cash position.
- Funded for 4 tenement drilling campaigns in 2024 focused on lithium and nickel discovery.

Four tenement drilling program progressing

- Drilling at Two Tanks tenement completed.
- Heritage surveys progressing for Bald Hill East, Fraser South and Cat Camp tenements.
- Awaiting approval of Fraser South Conservation Management Plan.

Promising Ni-Cu-Co prospects to be pursued by IGO at Fraser Range tenements

- BOA's Ballast NE and Eggpie prospects show medium to high prospectivity for Ni-Cu-Co bearing mafic-ultramafic rocks.
- Ground electromagnetic surveys are planned over both prospects to identify potential Ni-Cu sulphide accumulations. IGO Nova Ni-Cu deposit was discovered using same methods.

Optimisation of tenement portfolio and diligent cash management continues

- Giles and Transline West (2) tenements in Fraser Range surrendered following BOA review of prospectivity.
- Option to pursue Kookaburra Well tenement in NE goldfields terminated.
- Final award of Ant Hill tenement (E63/2231) in highly prospective Lake Johnston, WA.

Boadicea Resources Limited (ASX:BOA) ended the June quarter with \$2M in cash and no debt which leaves the company well-funded to achieve its planned activities.

Four tenement drilling program progressing

Subject to final approvals, BOA is preparing to drill the Cat Camp, Bald Hill East and Fraser South tenements that are focused on our core lithium and nickel exploration assets in Western Australia (refer Figure 1).

The Bald Hill East tenement is located approximately 2kms from the Bald Hill lithium mine (26.5Mt @ 1% Li₂O resource¹) and seen on Figure 2. BOA will target a potential extension to the mineralised zone as shown.

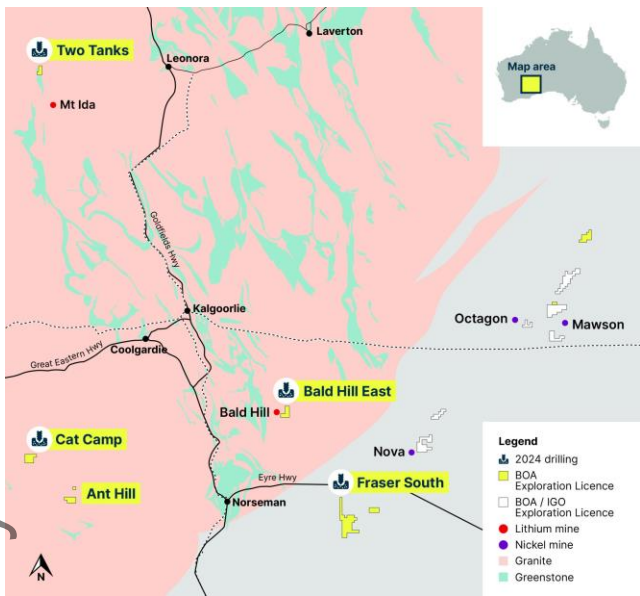

Figure 1 – BOA tenements to be drilled in 2024 in southern Western Australia

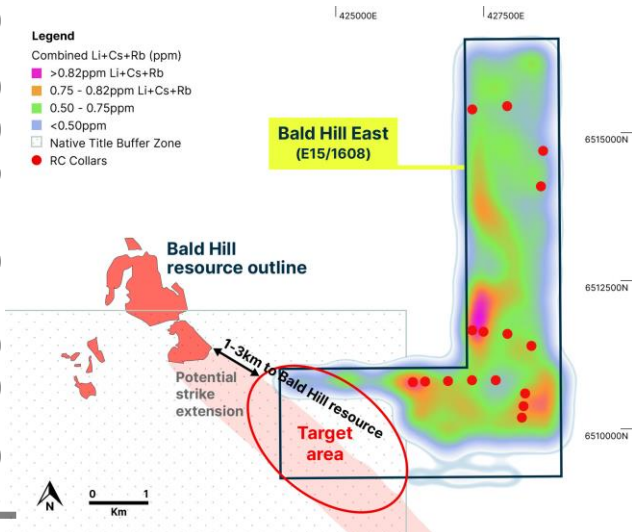

Figure 2: The Bald Hill East tenement showing target area for drilling and proximity to the Bald Hill lithium mine

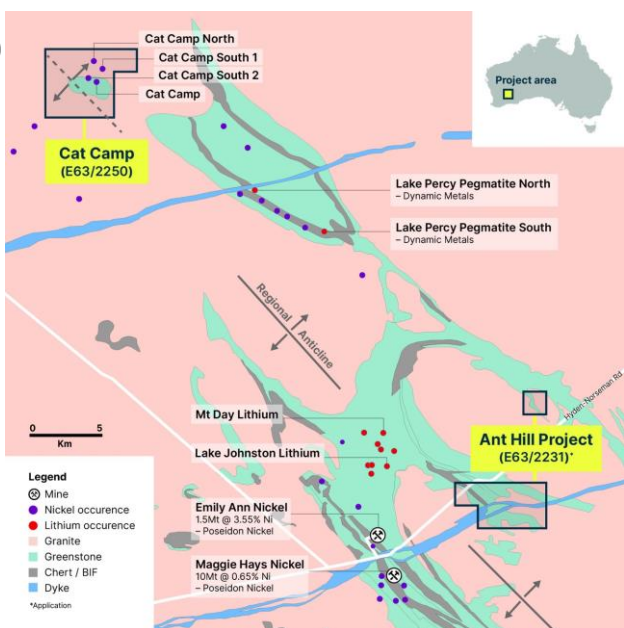

Figure 3: Location of the Cat Camp tenement in the emerging Lake Johnston/Lake Percy lithium province

For personal use only

The Cat Camp tenement is in the Lake Johnston/Lake Percy region (refer Figure 3). BOA will focus drilling over the area of known pegmatites and nickel mineralisation. Local pegmatites are shallow and thick and surface geochemistry has highlighted areas of anomalous lithium which will be the target of the drill program.

In the Fraser Range, BOA is planning to drill the Snowys Prospect – a highly conductive anomaly identified from an electromagnetic survey over the Fraser South tenement, as shown in Figure 4.

Massive sulphides in mafic-ultramafic intrusions in the Fraser Range are the host rocks for Ni, Zn, Cu and Co mineralisation which are highly conductive. The Snowys Prospect has the potential for Nova (Ni-Cu-Co) or Andromeda (Zn-Cu) style modified Volcanogenic Massive Sulphides (VMS) mineralisation.

For personal use only

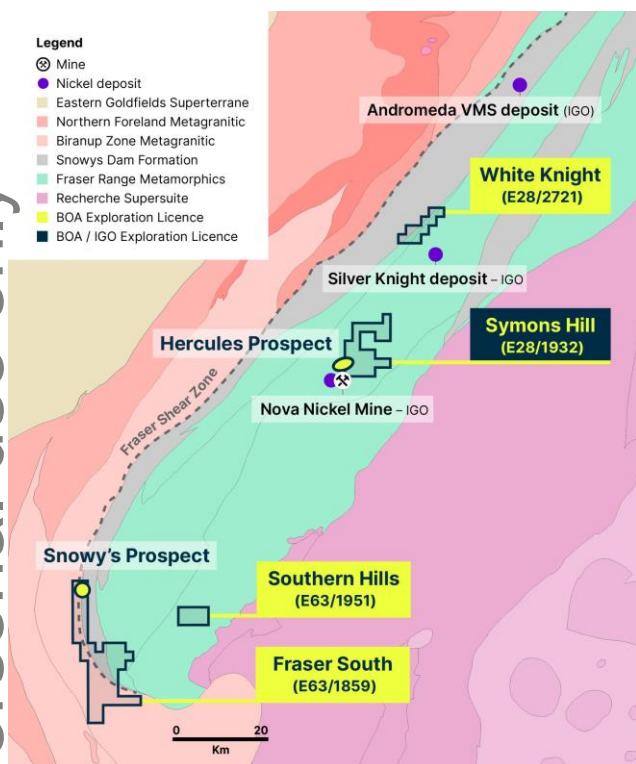

Figure 4: Location of the Snowys Prospect in the Fraser South tenement, Fraser Range.

Heritage surveys over the three tenements are currently being undertaken and BOA awaits the approval of its Conservation Management Plan prior to drilling the Snowys Prospect at Fraser South.

Drilling completed at Two Tanks

During the quarter, BOA announced the results of the Two Tanks drilling program^{2,3,4} in the Mt Ida region of WA, an emerging lithium province (refer Figures 5,6).

Geochemical analysis of samples taken from the drill program prior to analysis indicated fractionated pegmatitic units exhibiting potential for lithium mineralisation at depth.

The 18-hole air core drilling program drilled 1,296m. Multi-element assays recently received confirm a consistent degree of fractionation, as indicated by the K/Rb ratio, with most units showing a ratio of below 40, consistent with a fractionated pegmatitic unit.

The drilling campaign at Two Tanks also investigated the positioning and characteristics of the Copperfield Granite contact, with several holes designed to intersect and drill past the contact. The targeting was successful in defining and characterising the contact to a prospect level accuracy and will aid in future drill hole planning. Establishing depth trends to pegmatite fractionation and potentially Li grades will be a key part of the future exploration strategy at Two Tanks.

Figure 6: Summary map of the April 2024 drilling campaign at Two Tanks, showing highlights of assayed pegmatite intervals. The red highlighted area will be the next focus of exploration.

Fraser Range

IGO operated tenements

Symons Hill (E28/1932), Transline North (E28/2849), Transline South (E28/2866)

IGO Limited (ASX:IGO) operates three of the 12 exploration tenements held by BOA in the Fraser Range, Western Australia under agreement with BOA¹ as shown in Figure 7.

Drilling over the Ballast NE and Eggpie prospects in the Transline North (E2/2849) and Transline South (E28/2866) tenements has resulted in both prospects being evaluated as highly prospective for nickel, copper and cobalt mineralisation².

IGO will now conduct ground electromagnetic surveys to identify potential Ni-Cu-Co sulphide accumulations over the large Ballast magnetic “eye” feature at Ballast NE (refer Figure 8) and the Eggpie prospect².

Notably, the Nova Ni-Cu deposit was discovered using the same conventional methods: soil geochemical surveys, air-core drilling, followed by Moving Loop Electromagnetic (MLEM) surveys and Reverse Circulation (RC) drill testing. Ni-Cu-bearing mafic and ultramafic (MUM) magmas and the rare magmatic processes that are required to form massive Ni-Cu sulphide deposits have occurred along the entire length of the Fraser Range belt. IGO has developed an in-house Mafic Prospectivity Index (MPI). The mafic rocks encountered at both Eggpie and Ballast NE rate highly on this index, indicating potential for Ni and Cu analogous to the Nova mafic intrusion.

Optimising the BOA portfolio

In line with BOA’s policy to focus its resources and portfolio on high grade exploration tenements, following a geological review of the prospectivity, the company has surrendered its interest in the Giles and Transline West (2) tenements in the Fraser Range and Kookaburra Well tenement in the NE Goldfields region.

BOA was granted the Ant Hill tenement in late 2023 and final award was confirmed during the quarter. BOA considers the Ant Hill tenement to be highly prospective and it will form a core part of the BOA portfolio for lithium in the Lake Johnston region.

Management comment

During the period, BOA has sold its \$306,551 shareholding in Trigg Minerals Limited (ASX: TMG)¹. The sale reflects BOA’s strategic decision to divest its holdings in TMG and provides BOA with additional capital to advance its core exploration projects.

The shareholding in TMG was part of the consideration paid by TMG when buying a 90% interest in four Queensland tenements from BOA in Q12. BOA is free carried by TMG for its remaining 10% interest in the four tenements.

BOA presented at the RIU Sydney Resources Round-up from 7-9 May and the Noosa Mining conference in mid-July. Copies of the presentations from both conferences can be find at the BOA website at [Announcements – BOA Resources](#).

The 2024 budgeted expenditure allocates 76% of BOA’s capital for direct in-ground activities. The company continues to maintain a tight control on administration and personnel costs to ensure efficient use of its

capital. Management recognises the challenging environment for junior explorers and will be fine-tuning the planned drill programs to ensure they are optimally located to deliver results and as efficiently as possible. The planned Heritage Surveys have suffered delays and as a result, the planned drilling for Q3 will be conducted later in the year. Current plans are shown in Table 1 below.

BOA will focus on completing the evaluation of its Fraser Range holdings as well as the Koongulla tenements in the Paterson Province. These tenements are highly prospective for gold mineralisation and BOA will be seeking a partner for the drilling of these tenements.

BOA launched its new website in late March and shareholders can register their interest to receive updates to their email inbox at www.boaresources.com/contact/.

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.	<p>Individual 1m samples were taken via an inline cone type splitter attached to the aircore drill rig cyclone and laid out in clearly separated piles on the ground.</p> <p>1 metre samples taken by hand spear into labelled calico bags</p> <p>Composited samples between 2 and 4 metres were taken by BOA representative, using standard calico sampling bags by spearing of 1m sample piles placed on ground by drill crew, using sample buckets.</p> <p>Intervals of interest, to be assayed, determined by supervising geologist on the basis of observed geology, magnetic and mineralogical features.</p> <p>1m sample intervals determined by pneumatic sample release placed on cyclone.</p>
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	<p>Aircore Drilling</p> <p>Industry standard aircore sampling practices employed and supervised by geological staff. A cone type splitter was used for sub-sampling.</p> <p>Metre marks for sampling cut points clearly demarcated on drill rig and followed by drill crew.</p>
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Aircore drilling produced 1metre bulk piles. Spearing of bulk piles was used to produce either 1m or composited samples of between 2m and 4m. A selection or 1m and composited samples were submitted for analysis, crushed and pulverised to 85% -75µm before analysis.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc.).	Aircore drilling was provided by Gyro Drilling, based in Kalgoorlie in standard configuration, drilling a nominal 85mm diameter hole using a blade or percussive hammer, as dictated by lithology.

For personal use only

Criteria	JORC Code explanation	Commentary
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Sample recovery assessed and recorded by supervising geological staff
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Industry standard aircore drilling techniques used and supervised by geological staff. Any sample recovery or representivity issues immediately raised with drilling contractors and rectified.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No sample bias effects observed.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	All samples were described, and descriptions recorded in a digital data base.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.	All drilling was logged on a per-metre basis, recording a number of qualitative descriptors of the rocks encountered, such as weathering, colour, grain size, constituent minerals, alteration, veining, as well as detailed comments on geological observations to aid interpretation.
	The total length and percentage of the relevant intersections logged.	The entire drill program was logged
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken.	N/A
	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	A cone type splitter was used for primary 1m sampling of reverse circulation drilling and a handheld spear tool was used for sample compositing.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	Aircore drilling produced 1m primary samples as bulk piles. Spearing of bulk piles was used to produce 1m and composited samples of between 2m and 4m. A selection of primary and composited samples were submitted for analysis, crushed and pulverised to 85% -75µm before being assayed for a 48 multielement suite (including lithium and associated LCT pegmatite indicator elements) using mixed acid digest and ICP-MS/ICP-OES finish.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	~200g of sample was pulverised and a sub-sample was taken in the laboratory and analysed.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled.	All logged intervals of interest (pegmatites) were sampled at 1m intervals in their entirety, with several metres of composited waste on the footwall and hanging wall side. Samples sizes were approximately 2kg per sample and considered appropriate for geological setting and assaying techniques used.

For personal use only

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	A selection of sample composites was assayed for lithium and other elements by a combination of ICP-MS and ICP-OES, using a 4-Acid digest method. A sub-selection of samples was also assayed for Au via a 50g lead collection fire assay, followed by ICP-MS.
	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	Geophysical tools not used.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Standards and duplicates were taken at a rate of 1 in 25 during primary sampling.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	Company personnel and consultants have observed the assayed samples
	The use of twinned holes.	N/A
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Field data were all recorded in field notebooks and sample record books and entered into a digital database
	Discuss any adjustment to assay data.	No adjustments were made.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Hole and sample location is based on GPS coordinates +/- 3m accuracy.
	Specification of the grid system used.	The grid system used was MGA94 Zone 51
	Quality and adequacy of topographic control.	Topography control is +/- 10m.

For personal use only

For personal use only

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	<p>Data spacing for reporting of Exploration Results.</p> <p>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</p> <p>Whether sample compositing has been applied.</p>	<p>Drill hole orientation and distance was oriented perpendicular to mapped target strike trends. Targets were tested with one drill hole per target, with no strike extension being tested at this stage.</p> <p>No mineral resource or ore reserve calculations</p> <p>Sample compositing of 2m-4m performed on selected intervals in zones of low potential for mineralisation.</p>
Orientation of data in relation to geological structure	<p>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</p> <p>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</p>	<p>Drilling azimuth estimated to be oriented perpendicular to strike of geological units of interest with an oblique angle of incidence of up 70°, depending on actual dip of units, uncertain at this stage of exploration</p>
Sample security	<p>The measures taken to ensure sample security.</p>	<p>Samples were securely kept in numbered bags until delivered to the laboratory</p>
Audits or reviews	<p>The results of any audits or reviews of sampling techniques and data.</p>	<p>Sampling techniques are consistent with industry standards</p>

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p> <p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>The E29/994 tenement is 80% owned by Boadicea. 20% is owned by Mark Selga.</p>
Exploration done by other parties	<p>Acknowledgment and appraisal of exploration by other parties.</p>	<p>The area was previously explored for LCT pegmatites in 2022 by Zenith Minerals.</p> <p>Regional and prospect-scale geological mapping aided in drill hole planning.</p>
Geology	<p>Deposit type, geological setting and style of mineralisation.</p>	<p>The regional lithium prospectivity is interpreted to be associated with the large Copperfield Granite which may be a source of the Lithium-Caesium-Tantalum (LCT) pegmatites. A prospective LCT corridor is interpreted between the contact with the Copperfield Granite in the east and the Ida Fault in the west.</p>
Drill hole information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <p>easting and northing of the drill hole collar</p> <p>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length.</p> <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<p>A summary table of all drill holes is provided in the body of this announcement.</p>
Data aggregation methods	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</p> <p>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical</p>	<p>Average grades spanning several composited intervals was averaged by interval length weighting (a 6m interval consisting of a 2m and a 4m composite would weight the composites at 2 (1/3) and 4 (2/3) respectively when reporting the average).</p>

For personal use only

Criteria	JORC Code explanation	Commentary
	<p>examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	
Relationship between mineralisation widths and intercept lengths	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</p>	<p>Apparent widths reported in this announcement and the true relationship of drilling and geological orientation is not fully known at this stage, only inferred from mapped outcrop and down-hole intersections.</p>
Diagrams	<p>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</p>	<p>Appropriate maps are included as part of this announcement.</p>
Balanced reporting	<p>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>	<p>The reporting of results is deemed to offer a sufficient and balanced summary at the current level of understanding of the project.</p>
Other substantive exploration data	<p>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>All other relevant exploration data and targeting discussed in previous announcements, regarding Two Tanks.</p>
Further work	<p>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>Results are expected for assaying of intervals of interest, selected on the basis of observed pegmatites and/or veining in drilling.</p> <p>Numerous areas of extension, both along strike of currently known pegmatites, as well as other pegmatites, not yet intersected by drilling. A geological fact map is in being generated on an ongoing basis.</p>

Competent Persons Statements

The information in this Announcement that relates to Exploration Results was compiled and or thoroughly reviewed by Mr Graeme Purcell, who is a Director of the Company and is a Member of the Australian Institute of Geoscientists (Membership number 4722). Mr Purcell has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves'. Mr Purcell consents to the inclusion in the Report of the matters based on his information in the form and context in which it appears.

Forward Looking Statements Disclaimer

Information included in this release constitutes forward looking statements. Often, but not always, forward looking statements can generally be identified by the use of forward-looking words such as "may", "will", "expect", "intend", "plan", "estimate", "anticipate", "continue" and "guidance" or other similar words, and may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production or construction commencement dates and expected costs or production outputs. Forward looking statements inherently involve known and unknown risks, uncertainties and other factors that may cause the company's actual results, performance, and achievements to differ materially from any future results, performance, or achievements. Relevant factors may include, but are not limited to, changes in commodity prices, foreign exchange fluctuations and general economic conditions, increased costs and demand for production inputs, the speculative nature of exploration and project development, including the risks of obtaining necessary licenses and permits and diminishing quantities or grades of reserves, political and social risks, changes to the regulatory framework within which the company operates or may in the future operate, environmental conditions including extreme weather conditions, staffing and litigation.

Forward looking statements are based on the company and its management's assumptions made in good faith relating to the financial, market, regulatory and other relevant environments that exist and affect the company's business operations in the future. Readers are cautioned not to place undue reliance on forward looking statements.

Forward looking statements are only current and relevant for the date of issue. Subject to any continuing obligations under applicable law or any relevant stock exchange listing rules, in providing this information the company does not undertake any obligation to publicly update or revise any of the forward-looking statements or advise of any change in events, conditions or circumstances on which such statement is based.
