

ARGO AND BOKORO DRILLING RESULTS

Predictive Discovery Limited (ASX:PDI) ("PDI" or the "Company") is pleased to announce drilling results for 458 holes for 28,388m at the Argo and Bokoro areas of its 5.38Moz¹ Bankan Gold Project in Guinea. Initial resource development drilling results are reported from the Sounsoun target at Argo, where PDI is aiming to define a maiden Mineral Resource estimate. Further exploration drilling results are also reported from multiple other Argo targets, as well as from Bokoro located immediately south of the Argo permit, with PDI's strategy to maintain a solid pipeline of exploration targets.

HIGHLIGHTS

- Sounsoun resource development drilling has defined an E-W trending shear zone that is mineralised over at least 700m so far. Best new intercepts include **4.05m @ 11.44g/t** from 103m, **11m @ 1.42g/t** from 74m, **9m @ 1.46g/t** from 50m, **10m @ 1.07g/t** from 179m and **9m @ 0.78g/t** from 42m.
- Exploration drilling at other Argo targets has outlined further positive results, including:
 - Somo: multiple mineralised zones in saprolite across one line of AC holes, including a best intercept of **12m @ 4.82g/t** from 10m.
 - Sedadiou: new mineralised zone encountered as a potential south-western extension of the Sinkoumba trend, with intercepts of **6m @ 2.16g/t** from 60m and **4m @ 2.13g/t** from 72m.
 - Sinkoumba: **5m @ 5.55g/t** from 48m intersected up-dip of previous result of 5m @ 3.70g/t² to confirm steeply dipping mineralised zone.
- Regional exploration has also extended south onto the Bokoro permit, with encouraging first pass AC drilling results of **10m @ 3.33g/t** from 24m, **2m @ 7.41g/t** from 34m, **8m @ 1.05g/t** from 18m and **2m @ 2.99g/t** from 50m.

PDI's Managing Director, Andrew Pardey, said:

"We are encouraged by initial resource definition drilling at Sounsoun, which recorded positive intercepts and has defined a shear zone which hosts mineralisation over a strike of at least 700m. Additional results are due imminently from Sounsoun. Resource definition drilling is also underway at the Fouwagbe target and we are looking forward to receiving results from this program. The Bankan Project has excellent exploration upside with 35km of major regional structure running through the permits. Delivering maiden Mineral Resource estimates from these initial Argo targets will be an important catalyst for the Company, highlighting growth potential beyond the NEB and BC areas."

"Our pipeline of exploration targets continues to be developed, with positive new results from the Somo, Sedadiou and Sinkoumba targets at Argo, as well as promising results from initial drilling on the Bokoro permit that sits between Argo and NEB."

¹ Refer to Compliance Statement at the end of this announcement.

² ASX announcement – Fouwagbe & Sounsoun Progress to Resource Development (12 June 2024).

SUMMARY OF DRILLING RESULTS

Results in this announcement are from resource definition drilling at Sounsoun (Argo) as well as regional exploration drilling at multiple other targets on the Argo permit and the southern part of the Bokoro permit (refer to Figure 1). In total, results for 458 holes for 28,388m are reported as summarised in Table 1.

Table 1: Summary of drill holes reported in this announcement

Location	Drill type	Holes	Metres
Sounsoun (Resource Definition and Regional Exploration)	DD	9	1,953
	RC	21	2,527
	AC	39	1,850
	Total	69	6,330
Other Argo (Regional Exploration)	DD	1	300
	RC	9	1,029
	AC	218	12,561
	Total	228	13,890
Bokoro (Regional Exploration)	AC	161	8,168
	Total	161	8,168
Total		458	28,388

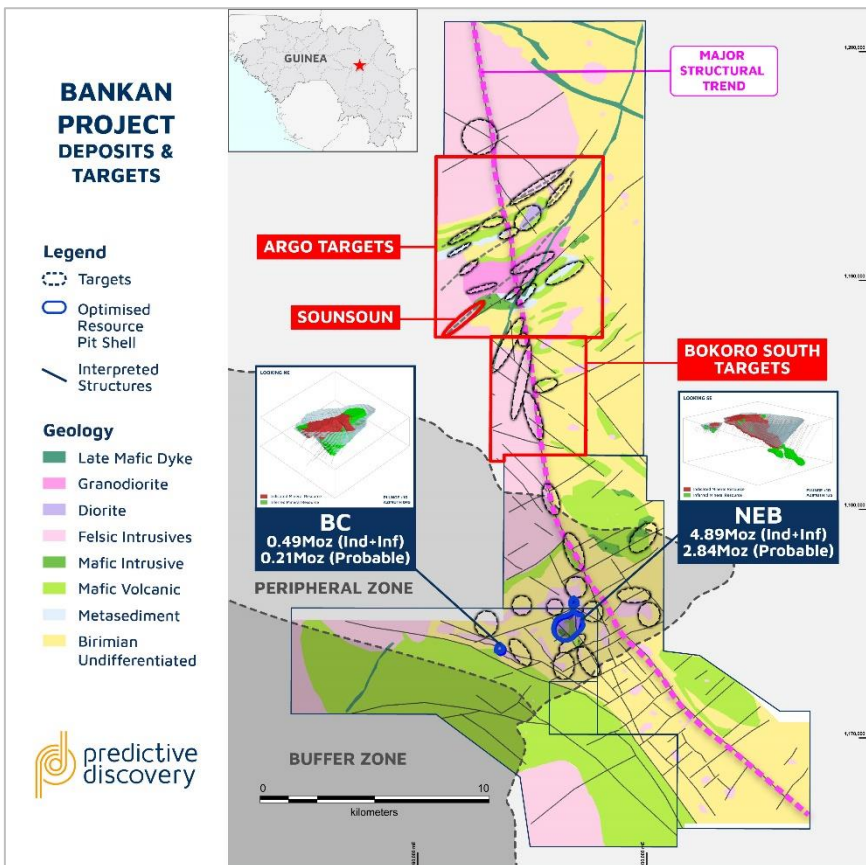

Figure 1: Summary of targets included in this announcement

SOUNSOUN DRILLING RESULTS

The Sounsoun target is defined by a 1.8km long, NE-SW orientated auger anomaly in the south-western corner of the Argo permit and on the Argo South Trend. Previous regional exploration drilling was focused along the NE-SW orientated trend and returned encouraging results, allowing the Sounsoun target to be upgraded to resource definition drilling with the aim of defining a maiden Mineral Resource estimate.

An updated structural interpretation was completed as part of the resource definition drilling program, which revealed an E-W trending shear corridor that appears to be one of the controls of the mineralisation at Sounsoun. Resource definition drilling has been focused along this E-W corridor. A total of 14 DD and 21 RC holes have been completed in the current program, with results from 9 DD and 21 RC holes included in this announcement.

Results received to date indicate this deformation zone, which is up to 10m thick and steeply dipping to the north, is mineralised over a strike length of at least 700m and continues along strike to both the east and west. The main deformation zone is framed by numerous secondary structures in the hanging wall and footwall, as well as numerous deformed units of a mafic intrusive. Best intercepts include:

- BNEDD0017: 4.05m @ 11.44g/t from 103m
- BNERC0076: 11m @ 1.42g/t from 74m
- BNERC0074: 9m @ 1.46g/t from 50m
- BNERC0071: 1m @ 5.62g/t from 54m
5m @ 1.19g/t from 107m
- BNEDD0019: 10m @ 1.07g/t from 179m
- BNEDD0013: 3m @ 1.17g/t from 79m
3m @ 1.11g/t from 103m
1m @ 5.36g/t from 137m
- BNERC0087: 9m @ 0.78g/t from 42m

Results from two lines of AC holes towards the south-western end of the Sounsoun target area have also been received as part of the regional exploration drilling campaign (refer to Figure 2). The north-eastern line returned significant intercepts of 6m @ 1.24g/t from 6m, 6m @ 0.59g/t from 12m and 2m @ 1.33g/t from 34m. No significant intercepts were recorded in the south-western AC line.

Results of the remaining 5 DD holes from the current resource development program are pending and due shortly. Additional N-S orientated infill drilling is planned along the E-W shear corridor to further define the mineralisation. Drilling is also planned further south-west along the NE-SW trending auger anomaly to follow up mineralised intercepts from previous exploration drilling campaigns.

A series of magnetic highs with a general E-W alignment have been identified 1km to 2km east of Sounsoun towards the regional NNE-SSW structural trend. Given the similar signature and orientation to Sounsoun, these targets warrant further investigation.

OTHER ARGO DRILLING RESULTS

Results have been received from multiple other Argo targets as part of ongoing exploration drilling efforts. The drilling mainly comprises AC lines as well as one DD hole from Sanifolon South and several RC holes at Sinkoumba, Sedadiou South and Sanikourou.

For personal use only

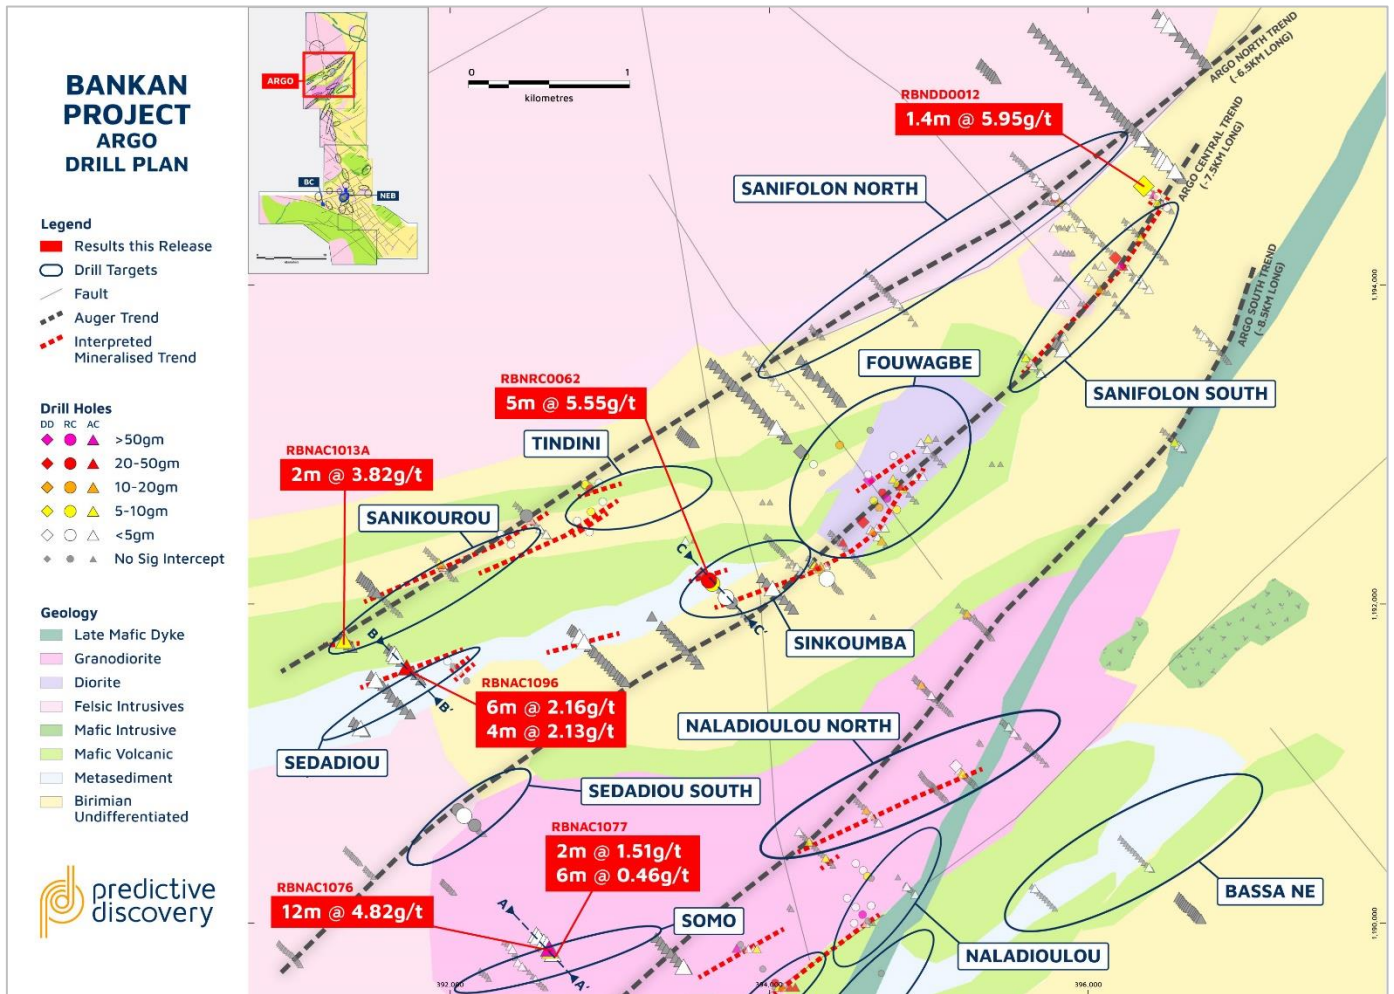

Figure 6: Argo drill plan

Somo

One new line of AC holes drilled at Somo has confirmed the potential of this target. Seven out of eight holes returned significant intercepts, including a best result of 12m @ 4.82g/t from 10m in RBNAC1076. The results appear to define multiple mineralised zones within saprolite, with additional drilling required to confirm the exact orientation and extent of the anomalous trend towards the east.

Figure 7: Somo cross section A-A'

Sedadiou

A new mineralised zone was encountered at Sedadiou with intercepts of 6m @ 2.16g/t from 60m, 4m @ 2.13g/t from 72m and 2m @ 0.64g/t from 80m in RBNAC1096. Mineralisation appears to be linked to the contact between a set of metasediments and a mafic unit, and could represent the south-western extension of the Sinkoumba trend, which in this sector is moving away from the Argo Central Trend. This new prospective corridor between Sinkoumba and Sedadiou warrants further testing by AC drilling.

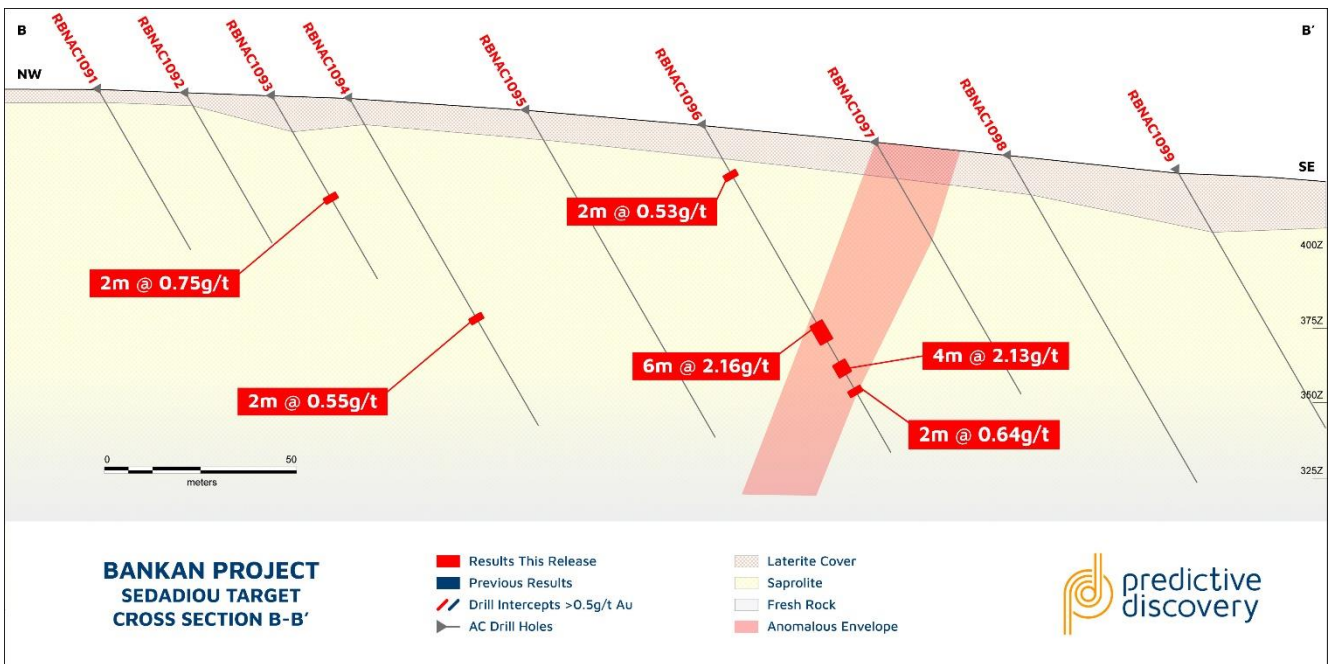

Figure 8: Sedadiou cross section B-B'

Sinkoumba

One line of four RC holes was drilled at the Sinkoumba target to follow up previous AC drilling. RBNRC0062 intersected 5m @ 5.55g/t from 48m within an interpreted steeply dipping structure and up-dip of previous result of 5m @ 3.70g/t from 75.8m in RBNDD0004.³

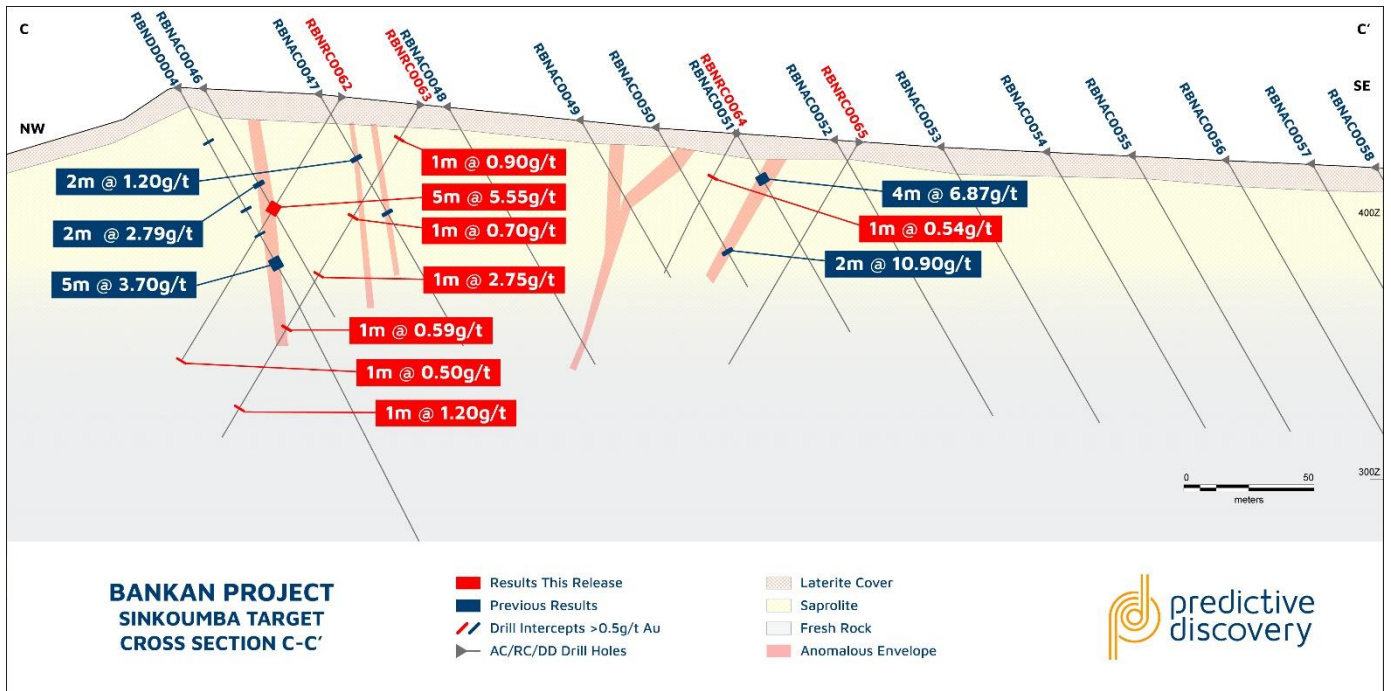

Figure 9: Sinkoumba cross section C-C'

Sanifolon South

One DD hole drilled at the north-eastern end of Sanifolon South returned a significant intercept of 1.4m @ 5.95g/t from 185.6m. Further up the hole, a modest intercept of 1m @ 0.91g/t from 33m associated with silica alteration was encountered.

Additional AC drilling which aimed to extend the anomalous trend further to the north-east encountered minor significant intercepts, including 2m @ 1.63g/t from 34m, 2m @ 1.43g/t from 24m and 2m @ 0.96g/t from 52m.

Sanikourou

Limited additional AC drilling returned an intercept of 2m @ 3.82g/t from 38m at the south-western end of the target.

³ ASX announcement – Fouwagbe & Sounoun Progress to Resource Development (12 June 2024).

For personal use only

BOKORO DRILLING RESULTS

PDI's regional exploration program has also extended south to test structural and geophysical targets on the southern part of the Bokoro permit. Extensive auger drilling has been completed, albeit with some gaps in the grid due to reduced wet season access, together with 161 AC holes for 8,168m drilled.

For personal use only

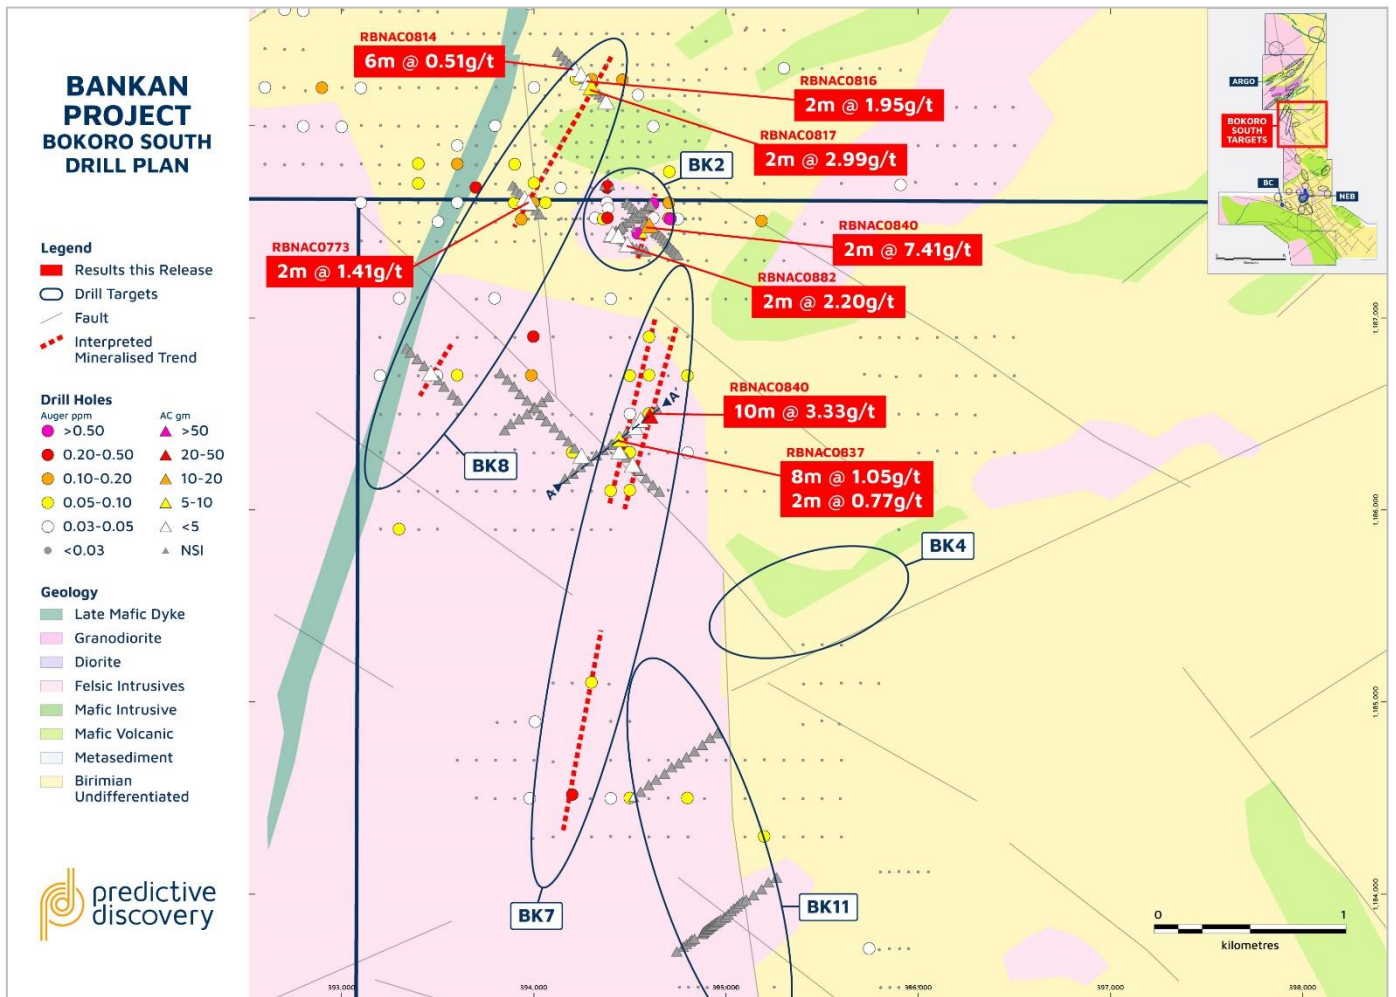

Figure 10: Bokoro South drill plan

BK7 is a conceptual target based on geophysics and interpreted as a faulted intrusive close to the basin margin adjacent to the northern extension of the NEB trend. Auger results indicate an 800m by 150m wide NNE-trending anomaly in the northern half of the BK7 target. First pass AC drilling at BK7 returned significant intercepts including 10m @ 3.33g/t from 24m in RBNAC0840 and 8m @ 1.05g/t from 18m in RBNAC0837, appearing to define two main mineralised zones within the auger anomaly.

Auger results in the southern half of the BK7 target, beyond an E-W valley that has not yet been covered by auger drilling, appear to indicate continuity of the anomaly, which could be up to 2.5km long if confirmed by future auger drilling.

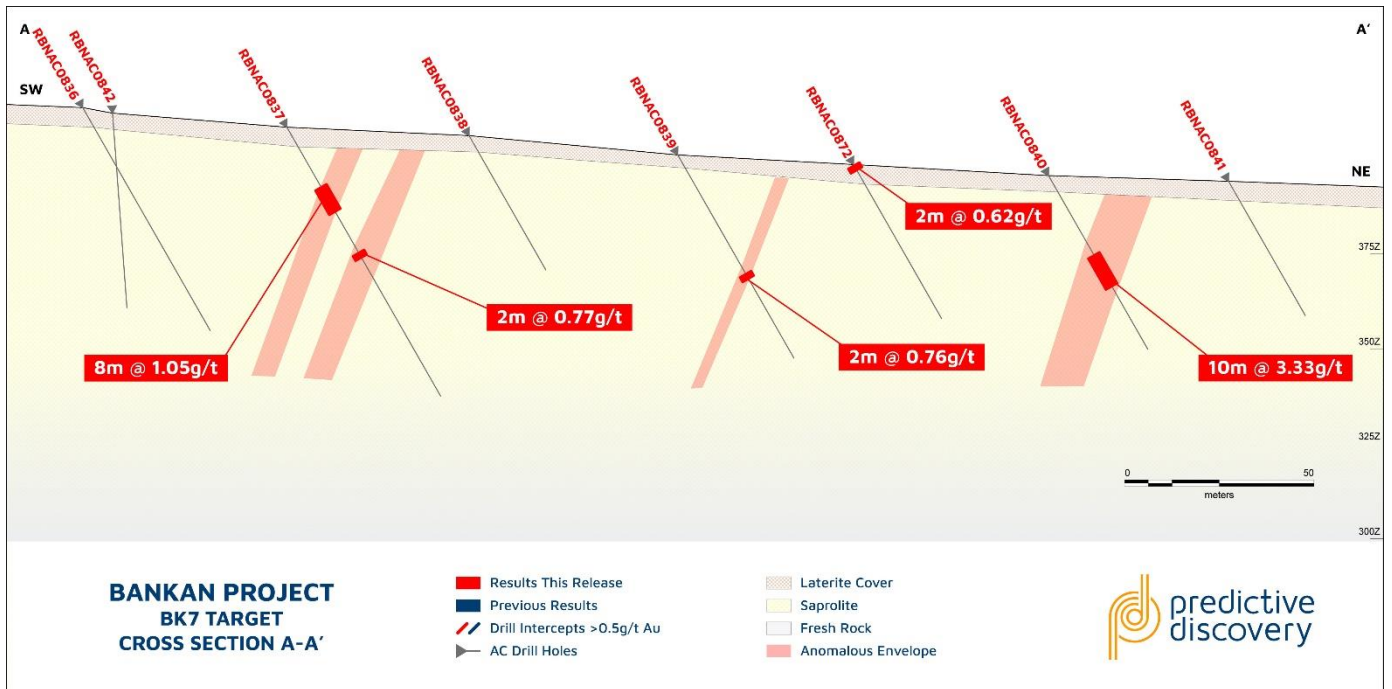

Figure 11: BK7 cross section A-A'

To the north of BK7, a strong auger anomaly has been identified at BK2. Initial AC drilling encountered notable intercepts of 2m @ 7.41g/t from 34m in RBNAC0785 and 2m @ 2.20g/t from 42m in RBNAC0882.

The BK8 target, initially identified by its southern half in the Bokoro permit, extends northwards onto the Argo permit. First pass AC drilling identified a potential 1.7km long trend with intercepts of 2m @ 2.99g/t from 50m, 2m @ 1.95g/t from 50m and 6m @ 0.51g/t from 22m on the northern AC line, 2m @ 1.41g/t from 20m on the central AC line, and 2m @ 0.84g/t from 30m on the southern line. The NNE-SSW orientation of this trend appears to be consistent with BK7 trend.

Two lines of AC holes were drilled on the BK11 target, returning a single significant intercept of 2m @ 0.84g/t from 30m. The mineralised zone potentially lies further west on the BK7 trend, and this area will be tested by AC drilling when the wet season ends.

DRILLING PROGRAMS AND NEXT STEPS

PDI has a range of drilling programs planned for the second half of 2024 as shown in Figure 12, which are focused on further growing and upgrading the current 5.38Moz Mineral Resource⁴ to support the Definitive Feasibility Study (“DFS”), and to maintain a healthy pipeline of exploration targets.

Resource definition drilling programs have been completed at BC, 800W and Gbengbeden. Further drilling is being planned at 800W to test for extensions of the mineralisation.

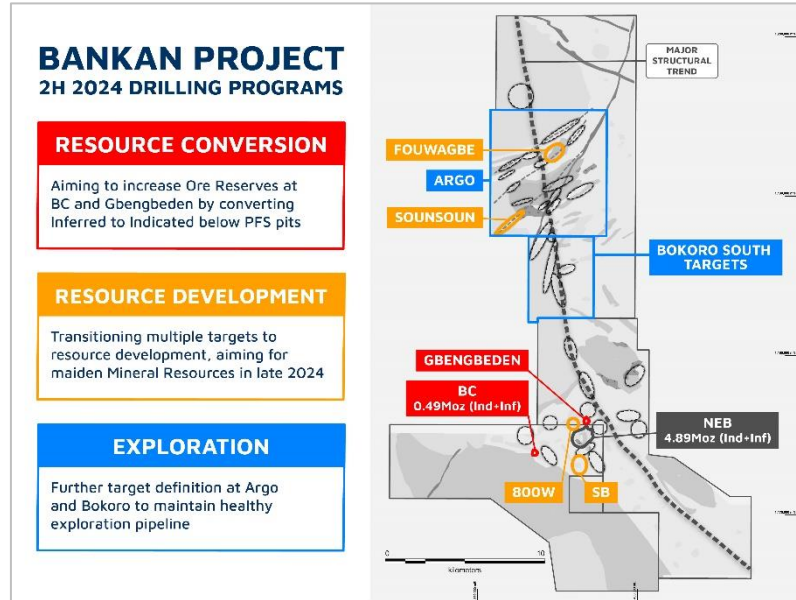

Figure 12: Bankan Project drilling programs

Initial resource development drilling has been completed at the Sounsoun target at Argo, with results from the final 5 DD holes due shortly. Additional drilling is being considered based on the latest interpretation and to follow-up previous results. Resource development drilling has commenced at the Fouwagbe target at Argo. The aim is to define maiden Mineral Resources at these targets by the end of 2024.

Regional exploration drilling programs will continue at Argo and the southern part of the Bokoro permit following completion of the wet season, to further develop the pipeline of targets moving through the exploration phases.

ABOUT PREDICTIVE DISCOVERY

PDI's strategy is to identify and develop gold deposits within the Siguiro Basin, Guinea. The Company's key asset is the Tier -1 Bankan Gold Project. A Mineral Resource of 5.38Moz has been defined to date at the NEB (4.89Moz) and BC (487Koz) deposits,⁵ making Bankan the largest gold discovery in West Africa in a decade.

PDI recently completed a Pre-Feasibility Study ("PFS") and Environmental & Social Impact Assessment, which are crucial steps to secure a mining permit for the Project. The PFS outlined a 269kozpa operation over 12 years, with a maiden Ore Reserve of 3.05Moz and strong financials.⁵

The Bankan Project is highly prospective for additional discoveries. PDI is also exploring targets near the NEB and BC deposits, and regionally to the north along the 35km gold super structure which runs through the permits.

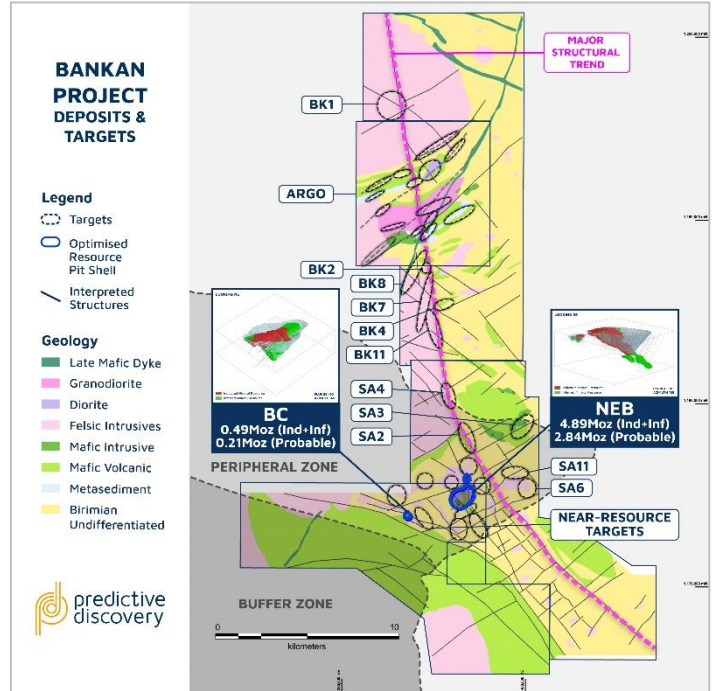

Figure 13: Bankan Project deposits and targets

COMPETENT PERSONS STATEMENT

The Exploration Results reported herein for resource development drilling at Sounsoun are based on information compiled by Mr Franck Bizouerne, who is a member of the European Federation of Geologists. Mr Bizouerne is a full-time employee of the Company and has sufficient experience relevant to the style of mineralisation and type of deposits being considered to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Bizouerne consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The Exploration Results reported herein for exploration drilling at Argo and Bokoro are based on information compiled by Mr Cédric Gineste, who is a member of the Australian Institute of Geoscientists. Mr Gineste is a consultant of the Company and has sufficient experience relevant to the style of mineralisation and type of deposits being considered to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Gineste consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

⁵ Refer to Compliance Statement at the end of this announcement.

COMPLIANCE STATEMENT

The information in this announcement that relates to the previous mineral resource estimate is from the announcement titled "Bankan Mineral Resource increases to 5.38Moz" dated 7 August 2023. The information in this announcement that relates to the previous ore reserve estimate is from the announcement titled "PFS Delivers Attractive Financials & 3.05Moz Ore Reserve" dated 15 April 2024.

The estimates are summarised in the tables below. The Company is not aware of any new information or data that materially affects the mineral resource or ore reserve estimates contained in this announcement and all material assumptions and technical parameters underpinning the mineral resource and ore reserve estimates continue to apply and have not materially changed.

Table 2: Bankan Gold Project Mineral Resource Estimate

Deposit	Classification	Cut-off (g/t Au)	Tonnes (Mt)	Grade (g/t Au)	Contained (Koz Au)
NEB Open Pit	Indicated	0.5	78.4	1.55	3,900
	Inferred	0.5	3.1	0.91	92
	Total		81.4	1.53	3,993

The production targets and forecast financial information referred to in this announcement is from the announcement titled "PFS Delivers Attractive Financials & 3.05Moz Ore Reserve" dated 15 April 2024. The Company confirms that all the material assumptions underpinning the production targets and forecast financial information derived from the production targets in the previous announcement continue to apply and have not materially changed.

The information in this announcement that relates to the previous exploration results have been cross referenced to the original announcement or are from announcements listed in the table below. The Company confirms that it is not aware of any new information or data that materially affects previous exploration results referred to in this announcement. The Company also confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the relevant original market announcements.

APPENDIX 3: JORC CODE TABLE 1

Section 1: Sampling Techniques and Data		
Criteria	JORC Code Explanation	Commentary
Sampling Technique	<p>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling</p> <p>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <p>Aspects of the determination of mineralisation that are Material to the Public Report.</p> <p>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</p>	<p>Samples assayed were cut diamond drill ("DD") core and reverse circulation ("RC") and aircore ("AC") drill chips.</p> <p>Core was cut in half with a core saw where competent and with a knife in soft saprolite in the upper sections of the DD holes.</p> <p>One metre RC chip samples were riffle split producing samples which weighed 2-3kg for submission to the assay laboratory.</p> <p>AC drill samples were collected at 1m intervals and submitted as 2m interval composites. For each 1m sample, an approximate 1 to 1.5 kg sub-sample was riffle split and combined to obtain an approximate 2 to 3 kg "2m-composite" sample for laboratory analysis.</p> <p>Sampling was supervised by qualified geologists. The majority of samples are 1m downhole, with diamond core sampling intervals breaking at lithological contacts where appropriate.</p> <p>All samples were dried, crushed and pulverised at the SGS laboratory in Bamako to produce a 50g fire assay charge with Au analysed by FAA505. Any samples which returned > 100gt were re-assayed using gravimetric method GO FAG50V. Duplicate samples were also retained for re-assay.</p>
Drilling	<p>Drill type (eg core, reverse circulation, open- hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc).</p>	<p>DD holes included in this announcement were from a EDM2000 multi-purpose rig. Diamond drilling is a combination of PQ, HQ and NQ core. Core was oriented using WELLFORCE orientation tools.</p> <p>RC/AC holes included in this announcement were from a Thor 5000 rig and EDM2000 rig.</p>
Drill Sample Recovery	<p>Method of recording and assessing core and chip sample recoveries and results assessed.</p> <p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	<p>Core recoveries were recorded by dividing the total length of core returned from each run by the length of the run. Overall core recoveries average around 92%, with the poorest recoveries (averaging 82%) in the first 40m of the drillholes.</p> <p>Overall RC and AC recovery is very good at 90%. However, samples in the first metre have lower than average recovery from the collaring process.</p> <p>Drill holes with poor recoveries were re-drilled within a radius of around 3 to 5m from the initial collar. A regularity of the recovery pattern downhole suggests considerable lag between the sample being generated at the hammer and reporting to the cyclone.</p> <p>Drillers do not always adhere to the metre marks on the mast, leading to randomly occurring overlength and underlength samples.</p> <p>The splitters are regularly checked and cleaned to ensure sample build up is minimised.</p> <p>The RC and AC rig cyclones are regularly cleaned (several times during drilling and between drilling) in order to minimise sample accumulation and contamination, and to increase the recovery rate.</p> <p>No relationship between sample recovery and grade has been analysed. It is unlikely that the grade of the RC drill samples has been biased, however the combination of regularly and randomly occurring sample weight variations will lead to a degradation of the local grade estimate and a higher than necessary nugget, as well as increased inaccuracy in the spatial delimitation of ore waste boundaries.</p>

For personal use only

<p>Logging</p>	<p>Whether core and chip samples have been geologically and geotechnical logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</p> <p>Whether logging is qualitative or quantitative in nature. Core (or costean/Trench, channel, etc) photography.</p> <p>The total length and percentage of the relevant intersections logged.</p>	<p>All drill samples were logged systematically for lithology, weathering, alteration, veining, structure and minor minerals. Minor minerals were estimated quantitatively. The Competent Person considers that the availability of qualitative and quantitative logging has appropriately informed the geological modelling, including weathering and oxidation, water table level and rock type.</p> <p>Photographs have been taken of each core tray and chip tray.</p> <p>A WELLFORCE core orientation device was employed on all drilled core enabling orientated structural measurements to be taken.</p> <p>The Competent Person considers that the level of detail is sufficient for the reporting of Mineral Resources.</p>
<p>Sub-Sampling Technique and Sample Preparation</p>	<p>If core, whether cut or sawn and whether quarter, half or all core taken.</p> <p>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</p> <p>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</p> <p>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</p> <p>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</p> <p>Whether sample sizes are appropriate to the grain size of the material being sampled.</p>	<p>The DD samples were collected by longitudinally splitting core using a core saw or a knife where core was very soft and clayey. Routine samples were half-core, with predetermined diamond core duplicates being quarter-core. The sampling method is considered adequate for a DD program of this type.</p> <p>The RC/AC samples were collected by riffle splitting 2-3kg from 1m 30kg bulk samples collected directly from the cyclone attached to the drill rig. Sample quality and condition are logged critically and any loss of sample integrity will trigger the hole being immediately stopped. One blind field is inserted into the sample stream and assayed routinely. The sampling procedures are industry standard. RC/AC sample weights are recorded immediately after collection from the cyclone.</p> <p>Field duplicate results demonstrated no bias in the sample results.</p> <p>There is considerable scatter in the diamond duplicate pairs suggesting that the mineralisation is likely to be highly variable at a short scale, and this variability needs to be taken into account when planning future sampling programs.</p> <p>Sample sizes are considered to be appropriate to the grain size of the material being sampled.</p>
<p>Quality of Assay Data and Laboratory Tests</p>	<p>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</p> <p>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <p>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</p>	<p>All samples were assayed by SGS. Analysis of gold is by fire assay technique using SGS method FAA505 with a lower detection limit of 5ppb Au. Any samples with gold values exceeding 10g/t Au were re-assayed using SGS method FAA515 with a detection limit of 0.01g/t Au. Any samples with gold values exceeding 100g/t Au were re-assayed using gravimetric method GO FAG50V. Duplicate samples were also retained for re-assay.</p> <p>Field duplicates, standards and blank samples were each submitted in sequence every 15 samples.</p> <p>Diamond core duplicates were obtained by cutting the half core sample into two quarter core samples. As samples are not homogenised, some variation is expected.</p> <p>Duplicate and standards analysed were all within acceptable limits of expected values.</p> <p>Analysis of this QAQC data demonstrated that the DD/RC data is of acceptable quality to be used for Mineral Resource estimation.</p>

Verification of Sampling and Assaying	<p>The verification of significant intersections by either independent or alternative company personnel.</p> <p>The use of twinned holes.</p> <p>The verification of significant intersections by either independent or alternative company personnel.</p> <p>Discuss any adjustment to assay data.</p>	<p>At this stage, the intersections have not been verified independently.</p> <p>No twin holes have been conducted.</p> <p>Drillhole logging is completed on paper sheets and manually entered into a database on site. The data is managed by a company employee, who checks for data validation. Assay results are returned electronically from the assay laboratory and are merged into the assay table of the database.</p> <p>No adjustments or corrections have been made to any assay interval data. All intercepts are reported as drilled.</p>
Location of Data points	<p>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</p> <p>Specification of the grid system used.</p> <p>Quality and adequacy of topographic control.</p>	<p>All surface drill hole survey information is collected in-house using a Leica 18T RTK DGPS system. The project survey grid is tied to the West African GEOID Datum and WGS84 Zone 29N projection.</p> <p>All DD and RC/AC holes have been surveyed by using north-seeking WELLFORCE CHAMP gyro.</p>
Data Spacing and Distribution	<p>Data spacing for reporting of Exploration Results.</p> <p>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</p> <p>Whether sample compositing has been applied.</p>	<p>The Sounsoun target has been drilled on a 50m by 40m spacing in the central part of the E-W orientated shear zone and a 150m by 50m spacing further west along the structure. The drill spacing is aimed at defining a maiden Mineral Resource estimate.</p> <p>Exploration drill holes at other targets were planned on specific targets like auger anomalies or AC intercepts (for DD/RC follow-up holes) and did not always follow a set grid. Spacing of AC holes depends on their depth (blade refusal) to ensure suitable coverage.</p>
Orientation of Data in Relation to Geological Structure	<p>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</p> <p>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</p>	<p>Drilling at Sounsoun is orientated on NW-SE lines along a E-W trending shear zone. Additional drilling is N-S orientated drilling is planned. Drilling at some targets is earlier stage and the geometry of mineralisation is currently unknown.</p>
Sample Security	<p>The measures taken to ensure sample security.</p>	<p>Samples are stored in a guarded location close to the nearby Bankan Village. Samples are picked up and transported to Bamako by PDI/SGS truck. Coarse rejects and pulps will be eventually recovered from SGS and stored at PDI's office in Kouroussa or at the core shed.</p>
Audits or Reviews	<p>The results of any audits or reviews of sampling techniques and data.</p>	<p>CSA Global has reviewed the sampling techniques and chain of custody procedures at the project.</p>

Section 2 Reporting of Exploration Results

Mineral Tenement and Land Tenure Status	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p> <p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>The Bankan Gold Project consists of four <i>Permis de Recherche Industrielle (Or)</i>, or exploration permits, as follows:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Permit Name</th> <th style="text-align: left;">Area (km²)</th> <th style="text-align: left;">Holder</th> </tr> </thead> <tbody> <tr> <td>Kaninko</td> <td>98.22</td> <td>Mamou Resources SARLU</td> </tr> <tr> <td>Saman</td> <td>99.78</td> <td>Mamou Resources SARLU</td> </tr> <tr> <td>Bokoro</td> <td>99.98</td> <td>Kindia Resources SARLU</td> </tr> <tr> <td>Argo</td> <td>57.54</td> <td>Argo Mining SARLU</td> </tr> </tbody> </table> <p>The permits are located between 9°51'00"W and 10°03'24"W and between 10°32'26"N and 10°52'00"N, situated to the northwest, west and southwest of the town of Kouroussa in Guinea.</p> <p>The Kaninko, Saman and Bokoro permits are held by 100% owned subsidiaries of PDI. The Argo permit is subject to a joint venture, whereby PDI can progressively earn 90% by payment of US\$100,000 and can acquire the remaining 10% at a decision to mine in exchange for a 2% net smelter royalty on production. The permit expiry dates have passed and</p>	Permit Name	Area (km ²)	Holder	Kaninko	98.22	Mamou Resources SARLU	Saman	99.78	Mamou Resources SARLU	Bokoro	99.98	Kindia Resources SARLU	Argo	57.54	Argo Mining SARLU
Permit Name	Area (km ²)	Holder															
Kaninko	98.22	Mamou Resources SARLU															
Saman	99.78	Mamou Resources SARLU															
Bokoro	99.98	Kindia Resources SARLU															
Argo	57.54	Argo Mining SARLU															

		<p>PDI has submitted renewal documents in accordance with Guinean requirements. The renewal process is ongoing, and the Ministry of Mines and Geology has indicated its support to PDI for these renewals.</p> <p>Parts of the Kaninko and Saman permits, including the NEB and BC deposits, are situated in the Peripheral Zone of the Upper Niger National Park. The deposits are 21 km and 18 km, respectively, away from the closest point of the Core Conservation Area.</p> <p>PDI intends to apply for a mining exploitation title and enter into a mining convention with the Ministry of Mines and Geology to carry out exploitation activities within the area covered by the exploration permits.</p> <p>PDI has taken a robust approach to address the sensitivities associated with the location of the Project within the Peripheral Zone of the Upper Niger National Park and appointed ERM to prepare the ESIA and ESMP framework, which are essential prerequisites to be submitted by PDI when applying for the exploitation title.</p> <p>As a result of overlapping regulations and decrees governing mining activities in natural protected areas in Guinea, including the Upper Niger National Park's management plan, there is a lack of clarity on the legal basis for mining exploitation activities in the Peripheral Zone of the Upper Niger National Park. It is expected that a clear basis, as well as the framework and conditions for the development of the Project, will be provided in the mining convention to be entered into in connection with the Project.</p>
Exploration Done by Other Parties	Acknowledgment and appraisal of exploration by other parties.	<p>Previous exploration work has been completed in the Argo area by Cassidy Gold, including soil sampling, AC and RC drilling.</p> <p>Artisanal miners have extracted an unknown quantity of gold from shallow hand dug pits and shafts, with panning and loaming used to identify mineralised areas.</p>
Geology	Deposit type, geological setting and style of mineralisation.	<p>The Bankan deposits are hosted in Paleoproterozoic rocks of the Birimian Supergroup in the Siguiri Basin, which is host to several significant large active gold mining operations.</p> <p>The predominant rock types consist of felsic intrusives including granite and tonalite, with mafic to intermediate volcanics and intrusives. Metasediments including marble, chert and schists have also been observed.</p> <p>Weathering has formed a deep saprolite profile, with a pisolitic and nodular lateritic cover which hosts remobilised gold, generally above the primary deposits or dispersed a few tens of metres laterally.</p> <p>Sounsoun: The main trend consists in a sheared zone with pyrite as the main sulphide and silica/chlorite alteration. The mineralisation seems to be preferentially developed around the contact between the footwall tonalite and the overlying mafic/metasediment package.</p>
Drill Hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	See Appendix 1 to Appendix 3.

<p>Data Aggregation Methods</p>	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</p> <p>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	<p>Sampling was generally in 1m intervals.</p> <p>Up to 2m (down-hole) of internal waste is included for results reported at the 0.5g/t Au cut-off grade.</p> <p>Mineralised intervals are reported on a weighted average basis.</p>
<p>Relationship Between Mineralisation Widths and Intercept Lengths</p>	<p>These relationships are particularly important in the reporting of Exploration Results</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</p>	<p>In the E-W branch of Sounsoun, the mineralisation appears to develop along an E-W trending deformation zone plunging northwards by 60°. The drill holes are inclined at 60°, trending NW-SE across the orebody. Further drilling on a N-S orientation and 60°inclination is required to obtain true thickness intercepts.</p>
<p>Diagrams</p>	<p>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</p>	<p>Appropriate maps and sections are included in this release.</p>
<p>Balanced Reporting</p>	<p>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>	<p>Comprehensive reporting of the drill results is provided in Appendix 1 to Appendix 3.</p>
<p>Other Substantive Exploration Data</p>	<p>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>All other exploration data on this area has been reported previously by PDI.</p>
<p>Further Work</p>	<p>The nature and scale of planned further work (eg tests for lateral extensions or large scale step out drilling.</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>Refer to the text in the announcement for information on follow-up and/or next work programs.</p>
