

27 November 2024

Rabbit Trap Scandium Project

Highlights

- **New scandium project contains historic drill intercepts at the Malamute prospect and 3 newly identified “lookalike” magnetic anomalies that need drill testing**
- **At Malamute, laterite – hosted scandium is present over 400m x 500m area with multiple air core drill intercepts;**
 - 18m @ 217ppm Sc from 30m including 6m @ 331ppm Sc
 - 9m @ 197ppm Sc from 8m including 3m @ 272ppm Sc
 - 9m @ 242ppm Sc from 34m including 3m @ 373ppm Sc, and
 - 10m @ 270ppm Sc from 25m including 4m @ 295ppm Sc
- **Rabbit Trap located 50 kilometres north of the Fifield and Avondale Projects and comprises EL8666 which is subject to a Buy Option Agreement with Javelin Minerals Limited (JAV:ASX) and new adjacent ELA6848**
- **Subject to obtaining necessary regulatory approvals, drill testing of the magnetic anomalies planned for 1st Qtr. 2025**

Rimfire Pacific Mining (**RIM:ASX**, “**Rimfire**” or “**the Company**”) is pleased to provide an update for its new 100% - owned Rabbit Trap Scandium Project located 50km north of the Fifield and Avondale projects in central New South Wales (*Figure 1*).

Commenting on the announcement, Rimfire’s Managing Director Mr David Hutton said: *“The new Rabbit Trap Scandium Project offers multiple opportunities with laterite – hosted scandium overlying a magnetic anomaly at the Malamute prospect and three other newly identified “lookalike” magnetic anomalies that need drill testing.*

Strategically the Rabbit Trap project strengthens the Company’s pipeline of scandium targets and is consistent with Rimfire’s corporate objective to continue building a globally significant scandium resource inventory within central New South Wales – Australia’s scandium epicentre.

Subject to obtaining all necessary regulatory approvals, we plan to commence drilling in the first Quarter 2025 and look forward to providing shareholders with further updates as new information becomes available.”

As previously advised Rimfire has expanded its scandium exposure in central NSW following the execution of an Option to Purchase Agreement with Javelin Minerals Limited (JAV: ASX) for their Exploration Licence 8666 (EL8666). If Rimfire elects to exercise the Option to Purchase (by 30 April 2026 at the latest), then the exploration licence will become 100% - owned by Rimfire (see *Rimfire's ASX Announcement dated 31 October 2024*).

Rimfire has added to the Javelin tenement with a new Exploration Licence (ELA6848) which adjoins the northern and eastern margin of EL8666 (*Figure 2*).

Combined the two exploration licences cover an area of 310km² and are collectively known as the "Rabbit Trap Scandium Project" because of their proximity to the well-known Rabbit Trap Hotel (*est. 1929*).

Rabbit Trap Scandium Opportunities

Regionally the project lies north along strike from the company's Fifield and Avondale projects and covers a north trending belt of Ordovician – age mafic / ultramafic intrusive rocks (Alaskan – Ural style) that are prospective for a range of critical minerals including scandium, nickel cobalt and the platinum group elements (PGEs).

From Rimfire's work at Fifield and Avondale, scandium typically occurs within a strongly weathered laterite horizon overlying magnetic ultramafic (pyroxenite) intrusive rocks (*Figures 2 and 3*).

At Rabbit Trap wide spaced (e.g. 250 x 250m centres) reconnaissance air core drilling undertaken in 2019 and 2023 by previous explorers has identified strongly anomalous scandium (Sc) within a flat – lying weathered and lateritised pyroxenite at the Malamute prospect, i.e.

- 18m @ 217ppm Sc from 30 metres in MA07 including 6m @ 331ppm Sc,
- 9m @ 197ppm Sc from 8 metres in MA08 including 3m @ 272ppm Sc,
- 9m @ 242ppm Sc from 34 metres in MA44 including 3m @ 373ppm Sc, and
- 10m @ 270ppm Sc from 25 metres in MA48 including 4m @ 295ppm Sc.

Scandium at Malamute is present over a 400m x 500m area and remains open to the west.

Consistent with other scandium occurrences in the district, Malamute is characterised by a discrete magnetic anomaly which is "mapping" the underlying pyroxenite unit (*Figure 3*).

While Rimfire was originally attracted to the Malamute prospect as a single scandium target to supplement the Company's flagship Murga prospect (which contains the Murga North MRE and separate Murga Exploration Target) further to the south on the Fifield project, a review of publicly available magnetic imagery for the broader Malamute area has identified three additional multiple "look alike" magnetic anomalies which have never been drill tested.

As shown on *Figure 4*, three magnetic anomalies to the northeast of Malamute require drill testing to confirm the presence of underlying pyroxenite and determine their scandium prospectivity.

Initial field reconnaissance has shown that each magnetic anomaly lies in an area of little to no outcrop with the land subject to grazing and cropping agricultural practices (*Figure 5*).

Given the similarities with the Malamute magnetic anomaly and the confirmation of scandium in the Malamute drilling, Rimfire believes that the Rabbit Trap project offers multiple opportunities for the discovery of new laterite – hosted scandium occurrences associated with the untested magnetic anomalies.

Next Steps

The project lies on freehold agricultural properties and Rimfire personnel have commenced the process of obtaining landowner consent to undertake exploration activities.

Subject to obtaining all necessary regulatory approvals, Rimfire is planning to undertake air core drill testing of the magnetic anomalies during the first Quarter 2025.

JORC Reporting

Table 2: JORC Code Reporting Criteria

Section 1 Sampling Techniques and Data – Diamond Drilling

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	<p>This ASX Announcement details the results of historic air core drilling undertaken by Javelin Minerals Limited (JAV: ASX) on EL8666 which is located near the townsite of Albert in central NSW.</p> <p>Drilling was undertaken in two phases – in 2019 and 2023. Drillhole specifications are given in Table 1 of this ASX Release.</p> <p>Whilst all drill holes in the 2019 campaign were sampled (unless holes were abandoned before reaching target depths) only those holes that intersected favourable ultramafic basement lithologies were dispatched for analysis.</p> <p>The results were previously reported by Javelin in their ASX Releases of 2 December 2019 and 26 July 2023. The information in these JORC tables has been sourced from both ASX Releases.</p> <p>No new results have been reported.</p> <p>Sampling was conducted using an air core rig at Malamute. Air core samples were collected at 1m, 4m, and 5m intervals in a cyclone at the side of the drill rig and sub samples for laboratory analysis collected via a riffle or cone splitter. A split portion weighing approximately 2 kilograms was collected in numbered bags.</p>
	Include reference to measures taken to ensure sample representativity and the appropriate calibration of any measurement tools or systems used.	To ensure sample representativity each hole was cut and sampled from surface to EOH for analysis. Blank samples and reference standards were inserted into the sample sequence for QA/QC.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be simple (e.g., ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g.,	Air core samples were collected at 1m, 4m, and 5m intervals in a cyclone at the side of the drill rig and sub samples for laboratory analysis collected via a riffle or cone splitter. A split portion weighing approximately 2 kilograms was collected in numbered bags.

For personal use only

Criteria	JORC Code explanation	Commentary
	submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).	All historic drillholes reported in this ASX Announcement are air core drill holes, the specifications of which are included in Table 1.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Sample recovery was generally excellent in weathered lithologies
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	To ensure sample representivity, and because the geology of each drilling location is unknown (due to no previous drilling beneath the base of weathering), the entire drillhole was typically sampled for analysis, although not all samples were submitted for analysis.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	It is not known whether a relationship exists between sample recovery and grade. No indication of sample bias is evident or has been established.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Air core samples were geologically logged to a level of detail sufficient to support appropriate Mineral Resource estimation, although that was not the objective of the drilling outlined in this ASX Announcement.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	Geological logging of diamond drill core is qualitative by nature.
	The total length and percentage of the relevant intersections logged.	The entire length of drill holes was geologically logged.
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken.	N/A as non-core.
	If non-core, whether riffled, tube sampled, rotary split & whether sampled wet or dry.	Air core holes were sub sampled by rig mounted cone or riffle splitter
	For all sample types, the nature, quality, and appropriateness of the sample preparation technique.	Sub-sample methods appear appropriate for deposit and sample type using accepted industry practices.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	Not known as exploration data is historic.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	To ensure that sampling is representative of the in-situ material, field duplicates were taken at regular intervals and compared.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	The sample sizes are considered appropriate to the grain size of material being sampled.
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Assaying has all been by a commercial laboratory – ALS Pty Ltd. Scandium analyses were undertaken in 2019 using a lithium borate fusion (method

Criteria	JORC Code explanation	Commentary
		ME-XRF12n) which is a total digest and in 2023 using an aqua regia ICP-AES (method ME-ICP41) which is a partial method. The methods are considered suitable for the nature of scandium mineralisation encountered.
	For geophysical tools, spectrometers, handheld XRF instruments (pXRF), etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	N/A as no geophysical tools were used or results of using geophysical tools were included in this Report.
	Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.	Certified standards were submitted along half core samples to the laboratory.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	The historic significant intersections including in this Report have been verified by both Rimfire's Exploration Manager and Managing Director.
	The use of twinned holes.	N/A as no twinned holes drilled
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Javelin drill data was captured using excel spreadsheets.
	Discuss any adjustment to assay data.	There has been no adjustment to assay data.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Sample locations are recorded using handheld Garmin GPS with a nominal accuracy +/- 3m.
	Specification of the grid system used.	GDA94 Zone 55.
	Quality and adequacy of topographic control.	Handheld GPS, which is suitable for the early stage and broad spacing of this exploration.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	The location and spacing of drillholes discussed in this Report are given in Table 1 and various figures of this Report
	Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The data spacing and distribution of drilling referred to in this Report is not sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s).
	Whether sample compositing has been applied.	Sample compositing has been applied.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	No bias considered present.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	The relationship between the drilling orientation and the orientation of key mineralised structures is not known. At this stage it is not known whether there is a sampling bias.

Criteria	JORC Code explanation	Commentary
Sample security	The measures taken to ensure sample security.	Samples double bagged and delivered directly to the laboratory by company personnel.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No independent reviews undertaken at the time of drilling however Rimfire's senior company personnel including the Exploration Manager and Managing Director have reviewed the historic data with no negative issues identified.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	<p>This ASX Announcement details historic drill results for air core holes drilled at the Malamute prospect area which lies on EL8666 in central NSW.</p> <p>All work was undertaken on Private Freehold Land. The land is used primarily for grazing and cropping.</p> <p>As discussed in this ASX Release the tenement is owned by Javelin Minerals and Rimfire has entered into an Option Agreement whereby it can exercise the option and acquire the tenement 100%.</p>
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.	The tenements are in good standing, and all fieldwork is conducted under specific approvals from NSW Department of Planning and Energy, Resources and Geoscience.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Malamute has been the subject to some historic work which prior to 2019 has been primarily focussed on exploration for platinum group elements (PGEs). Helix Resources was a significant explorer operating in the area at the time.
Geology	Deposit type, geological setting, and style of mineralisation.	Scandium mineralisation occurs within flat – lying laterite horizons that have formed over Ordovician – age pyroxenite ultramafic units.
Drill hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth. 	All drillhole specifications are included within Table 1 of this ASX Announcement. All collar locations are shown on the figures included with this ASX Announcement.

For personal use only

Criteria	JORC Code explanation	Commentary
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the Report, the Competent Person should clearly explain why this is the case.	Not applicable as no drill hole information has been excluded.
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated.	A lower cut-off grade of 100 ppm scandium has been used in determining the reported intercepts. No top cuts have been used.
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	Length weighting has not been applied because all samples were of equal length.
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalents have been reported.
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the Reporting of Exploration Results.	The drill results included in this Report are considered to represent downhole widths.
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').	
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Included within the ASX Announcement
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.	All significant intercepts are included in this Report.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	There is currently no other substantive exploration data that is meaningful and material to report.

Criteria	JORC Code explanation	Commentary
Further work	The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).	Planned further work will comprise geological interpretation and drilling.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Not applicable at this stage

Competent Persons Declaration

The information in the report that relates to Exploration and Resource Results is based on information reviewed and/or compiled by David Hutton who is deemed to be a Competent Person and is a Fellow of The Australasian Institute of Mining and Metallurgy.

Mr Hutton has over 30 years' experience in the minerals industry and is the Managing Director and CEO of Rimfire Pacific Mining. Mr Hutton has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'.

Mr Hutton consents to the inclusion of the matters based on the information in the form and context in which it appears.

Forward looking statements Disclaimer

This document contains "forward looking statements" as defined or implied in common law and within the meaning of the Corporations Law. Such forward looking statements may include, without limitation, (1) estimates of future capital expenditure; (2) estimates of future cash costs; (3) statements regarding future exploration results and goals.

Where the Company or any of its officers or Directors or representatives expresses an expectation or belief as to future events or results, such expectation or belief is expressed in good faith and the Company or its officers or Directors or representatives, believe to have a reasonable basis for implying such an expectation or belief.

However, forward looking statements are subject to risks, uncertainties, and other factors, which could cause actual results to differ materially from future results expressed, projected, or implied by such forward looking statements. Such risks include, but are not limited to, commodity price fluctuation, currency fluctuation, political and operational risks, governmental regulations and judicial outcomes, financial markets, and availability of key personnel. The Company does not undertake any obligation to publicly release revisions to any "forward looking statement".
