ASX:ENV

**DRILLING RESULTS FROM THE NORTHERN SECTOR
EXPAND THE CODA NORTH MINERALISED DOMAIN
HIGH-GRADE TREO RUNS UP TO 8,926 PPM
STANDOUT INTERSECTIONS: 45.5M @ 2,869 PPM TREO
HIGH-GRADE HIGHLIGHTS: 18.6M @ 4,471 PPM TREO**

Enova Mining (ASX: ENV) is pleased to announce high-grade drill results from CODA North strengthening a robust resource base across its CODA Tenements

- **Drilling results establish the northern sector as a key mineralised zone, further expanding the main CODA North mineralised domain,**
- **Phase 1 drilling in CODA North Finalised:** 3,101m drilling unlocking the site's expanse of resource delineation and continuity,
- **Expanded exploration at CODA Central:** Six reverse circulation drill holes spanning 297m signal further advancement in a newly targeted zone,
- **1,000+ Samples Under Assay:** Analytical work underway at SGS Geosol Laboratory, Minas Gerais, with results set to augment resource potential,
- **Significant TREO¹ grades confirmed from 4 diamond drill holes and 5 reverse circulation drill holes,** marking a key milestone with the fourth batch of assays which are as follows,

| Hole ID | From (m) | To (m) | Intercept(m) | TREO (ppm) | NdPr % |
|--------------------|----------|--------|--------------|--------------|-------------|
| CDN-DD-0017 | 03 | 21.92 | 18.9 | 3,277 | 23.0 |
| <i>including</i> | 5.5 | 21 | 15.5 | 3,755 | 23.5 |
| CDN-DD-0018 | 13.65 | 27.55 | 13.9 | 3,249 | 25.2 |
| <i>including</i> | 16 | 27.55 | 11.6 | 3,677 | 26.9 |
| CDN-DD-0019 | 03 | 48.47 | 45.5 | 2,869 | 21.8 |
| <i>Including</i> | 06 | 29 | 24.6 | 3,923 | 22.1 |
| <i>including</i> | 4.45 | 23.0 | 18.6 | 4,471 | 22.2 |
| CDN-RC-0019 | 06 | 40 | 34 | 1,648 | 21.0 |
| <i>including</i> | 22 | 31 | 09 | 2,742 | 20.6 |
| CDN-RC-0020 | 09 | 41 | 32 | 2,744 | 22.0 |
| <i>including</i> | 17 | 35 | 18 | 3,770 | 23.3 |
| CDN-RC-0021 | 28 | 61 | 33 | 2,434 | 21.5 |
| <i>including</i> | 30 | 49 | 19 | 3,029 | 21.7 |
| CDN-RC-0022 | 0 | 18 | 18 | 2,282 | 20.1 |
| <i>including</i> | 10 | 17 | 07 | 3,477 | 21.5 |

| <i>including</i> | 04 | 10 | 6 | 2,754 | 21.6 |

¹ Significant TREO grades assays have been calculated at nominal cut-off 1,000ppm and 2000 ppm

- **Highlights of significant high-grade REE assays² in this announcement include:**

| Hole ID | From (m) | To (m) | Intercept | TREO (ppm) |
|-------------|----------|--------|-----------|------------|
| CDN-DD-0017 | 5.5 | 21 | 15.5 | 3,755 |
| CDN-DD-0018 | 17 | 24 | 7 | 4,632 |
| CDN-DD-0019 | 4.45 | 23.0 | 18.6 | 4,471 |
| CDN-RC-0020 | 17 | 35 | 18 | 3,770 |
| CDN-RC-0021 | 30 | 39 | 09 | 3,740 |
| CDN-RC-0022 | 10 | 15 | 05 | 3,760 |

- ✓ **Drilling results underscore the project's additional resource potential towards northern part of the tenement,**
- **Enova progresses metallurgical work by sending composite samples to specialised labs in Brazil and Malaysia for mineral characterisation and leach testing, crucial for realising CODA North's resource value,**
- **Recent drilling results has delineated mineralisation in northern sector, extending the footprint of CODA North mineralised domain with the strike remaining open across the unexplored zone,**
- **Exploration begins at the new target at CODA Central project, marking a new and significant growth opportunity for Enova,**
- **Enova's Strategic Advantage:**
 - **Strategically Located Potential Mineralisation:** Extensive, flat, and accessible pasture and farmland ideal for project development,
 - **Scope of Resource Expansion:**
 - Approximately 5km E-W strike extension of potential REE mineralisation confirmed at CODA North,
 - Additional high-potential project sites (CODA Central, East, XS, XN, and South) awaiting drilling,
 - **Strong Stakeholder Relationships:** Proven success in stakeholder (landowners, regulators, suppliers) engagement with a firm commitment to ESG principles,
 - **High-Quality MREO Potential:** Consistently 20%+ NdPr/TREO ratio, enhancing project value

² Significant high-grade REE assays have been calculated at nominal cut-off 3,000ppm

Enova CEO Eric Vesel commented:

Our latest drilling results expand the CODA North mineralised domain northward

"Recent drilling results confirm the discovery of mineralisation in the northern sector of CODA. This is a significant extension of the potential high-grade REE mineralisation at CODA North. This discovery, along with the data we've collected, is essential for refining our resource model and broadening our understanding of the deposit. Our exploration strategy, combining both wide-spaced and close grid drilling, ensures comprehensive coverage across the CODA North area. We will continue to keep the market informed as assay results are received and evaluated. We are confident these outstanding results can translate to significant resource, we also recognise the importance of confirming recovery and process parameters to commercialise CODA's massive rare-earth potential. Our current priority is metallurgical testing of our CODA mineralisation samples and confident our findings from this work will quickly lead to a practical leach solution. Progress to date has far exceeded our expectations, and we are committed to building on this positive momentum."

CODA North Mineralisation Extends with High-Grade Identified in the Northern Sector

Enova is pleased to announce assay results from nine new high-grade drill holes within the CODA North project. These results provide significant intercepts for previously unknown mineralised zones in the northern sector and add to the project's significant resource potential across an extensive, unencumbered area (Figure 2, Table 4). These assays confirm substantial mineralised thickness and the continuity of high-grade mineralisation, extending over a significant portion of the northern sector of CODA North project site. The latest data enhances our understanding of the resource's scale, continuity, and grade, bolstering Enova's ongoing exploration efforts and strengthening the growth outlook for the CODA North Project.

Enova Drills New Target in the CODA Central Project Area

Enova is excited to announce the completion of a scout reverse circulation (RC) drilling programme at the CODA Central project (Table 1 depicting drilling of 6 holes) as previously announced, marking a key milestone in the ongoing exploration of the CODA project. This strategy involved wide-area drilling and sampling which is critical for initial assessment of CODA Central's potential as the next rare earth element (REE) mineralisation project. With encouraging early signs, Enova is confident in uncovering additional mineralisation and expanding its resource base within this promising new frontier. Enova will announce assay results from this programme when available.

CODA Central drilling campaign has been delayed due to the wet crop season and will resume with further funding.

| Drilling | Project Area | Number of drill holes | Total meterage |
|---------------------|--------------|-----------------------|----------------|
| Diamond drill holes | CODA North | 24 | 1,310 m |
| RC drill holes | CODA North | 40 | 1,791 m |
| RC drill holes | CODA Central | 6 | 297 m |
| Total | | 62 | 3,398 m |

Table 1: Drilling statistics

Enova’s Exploration Progress Drives Significant Resource Growth

Recent drilling results from the northern sector of CODA North has revealed significant high-grade REE mineralisation within the Patos Formation, confirming a powerful and continuous REE system adding a ledge toward northern sector to the previously delineated east-west trending potential REE mineralisation. These discoveries surpass our initial projections, reinforcing the accuracy of our geological model and laying the groundwork for considerable resource growth and increased project value. The Board is enthusiastic about the continued exploration upside and remains focused on unlocking greater value for our shareholders.

Figure 3: Diamond drill core within saprolite and saprock representing kamafugite litho-unit

Figure 4: Enova's core samples are being stored in the diamond core box

Encouraging Drilling Results Validate High-Grade REE Mineralisation at CODA North

Recent drilling at the CODA North tenements has confirmed widespread high-grade rare earth element (REE) mineralisation. The drilling campaign, utilising both diamond drilling (DD) and reverse circulation (RC) methods, has successfully completed 3,101 meters across the CODA North project site (see Figures 2, 3, 4, 5, 6, and Table 1) and 297 meters in CODA Central project site. Over 1,000 samples from this drilling program are currently awaiting assay results at the SGS Geosol laboratory in Vespasiano, MG. Initial data analysis reveals extensive mineralised zones, underscoring the strong potential for significant expansion of the project's resource base.

Figure 5: Schematic cross section (only significant values such as maximum intercepts and high grades of the current announcement are shown)

Enova's Skilled Brazilian and Corporate Team Fuels Exploration Success

Enova's highly skilled team is diligently preparing samples using industry-standard techniques to ensure data accuracy. This collaborative effort, uniting geologists, technicians, and field personnel is central to the success of our exploration programs. Their expertise and unwavering commitment to precision are key drivers in uncovering significant mineral resources at CODA North. The Board is confident that their dedication will continue to deliver exceptional results and propel Enova's growth forward.

Strategic Potential of Enova's CODA REE Projects

- **Delineating a significant REE Project:** Large, high-potential REE targets in CODA North and CODA Central are currently under active exploration.
- **Additional High-Grade REE and Lithium Targets:** Four more prospective REE mineralised zones—CODA East, CODA XN, CODA XS, and CODA South await drilling, further expanding the project's resource potential. Lithium targets of East Salinas, Carai, Santo Antonio Do Jacinto and Resplendor located in Minas Gerais' Lithium Valley are prospective and currently under field review.
- **Byproduct of Potential Economic Grade:** CODA project contains potential economic grades of TiO_2 byproduct. Other metals of potential economic interest would be scandium and niobium.
- **Experienced Leadership with Proven Success:** Enova's board and management bring a strong track record in flagship project development and corporate growth.
- **Cost-Efficient Exploration with Significant Upside:** The company is executing cost efficient exploration with substantial upside potential, maximising shareholder value.
- **Strong Rare Earth Business Network:** Enova's directors have interests in rare earth refining, technical separation expertise and rare earth supply chain networks in Malaysia and internationally. This provides opportunities for Enova to supply REE product, form

alliances or take advantage of technology outside current supply chains dominated by China.

- **Experienced in Brazilian Exploration:** Enova’s local Brazilian team possesses extensive exploration and mining experience. The company benefits from their local insights and understanding to effectively explore and develop REE and Lithium resources.

Enova's Drilling Campaign Targets Resource Expansion and Upgrading

Enova’s next drilling phase at CODA North will focus on expanding and enhancing the high-grade REE mineralised zones revealed in recent assays. Employing a strategic combination of infill and step-out drilling, the campaign will aim to define the lateral extent and continuity of mineralisation. By increasing drill density in key zones, Enova is targeting a substantial upgrade of identified resources to higher-confidence classifications, driving the project's value and development potential.

In parallel, Enova’s team is undertaking detailed resource evaluation for optimising future drilling and carrying out metallurgical test work to deliver high-confidence resource categorisation that fully reflect the deposit's potential. These critical efforts will provide a robust foundation for future project milestones, including scoping studies and strategic opportunities for resource expansion, paving the way for long-term growth and value creation.

Beyond the high-priority work at CODA North, Enova has initiated drilling at the new targets in CODA Central Project, marking another significant step in unlocking the tenement’s vast potential. Future exploration campaigns are strategically planned across CODA East, CODA XN, CODA XS, and CODA South, with careful coordination around local crop planting seasons to optimise operations.

Additionally, Enova is advancing Lithium Valley Projects, broadening its resource portfolio and enhancing growth prospects. This diversified exploration approach underscores the company’s commitment to maximising value and unlocking the full potential of its extensive asset base.

ADVANCING CODA

The CODA tenements overlay the Patos geologic formation, with potential REE enriched Ionic Absorption Clays (IAC). Test work in progress at metallurgical laboratories within Brazil and abroad to investigate the metallurgical character of the CODA mineralisation. Mineral characterisation and particle size analysis is underway at CIT Senai, Belo Horizonte, MG. Results from this analysis will be used to determine a targeted mineral beneficiation and leaching programme. As a baseline for recovery, standard IAC leach tests for each type of mineralisation is in progress at ALS laboratories in Belo Horizonte, MG. Enova is in the progress of establishing a dedicated laboratory in Kuala Lumpur for metallurgical test work. Enova has access to a privately owned high accuracy ICP-MS assay facility, rare earth refinery laboratory and expertise. Over 70kg of CODA samples are in Kuala Lumpur for leach testing. CODA is well placed with mineralised zones of potential IAC with exceptionally high REE

grade. CODA’s broad areas of mineralised zones of exceptional thickness are expected to translate to a significant resource base giving longevity to future extractive operations.

REGIONAL GEOLOGY AND TENEMENT OVERVIEW

Enova is encouraged by the location and size of the tenements in relation to prospective geological features. The prospective geological unit present in the CODA project is composed of the Patos Formation. It formed during the Upper Cretaceous period, when a massive volcanic event occurred in the western part of Minas Gerais state. The volcanic activity exhibited both effusive (lava flows) and explosive (pyroclastic deposits) eruptions. The predominant rock type in this formation is kamafugite, which is classified as an alkaline-ultramafic rock. High-grade REE are also enriched in this formation.

Regionally the prospective unit consists of a horizontal bed of kamafugite, which can be up to 40 metres thick. Overburden at CODA varies from 0 to 30 metres. Weathering processes with thick clay zones are prevalent throughout this profile, leading to the accumulation of REE closer to the upper part of the formation. The rocks within this formation are predominantly soft and friable, with an extremely fine particle size. These characteristics are considered advantageous for the exploration of Ionic Clay REE deposits. Refer to Figure 12 below for the locations of the tenements at the CODA Project.

Significant historical exploration drilling results (Reference 1) confirm the potential for REE enriched IAC Southern CODA tenements where drilling has been completed. All intersections from CODA South start from surface and are open in all directions including depth.

TENEMENTS/PERMITS

The title holder of the CODA tenements currently is Rodrigo De Brito Mello (Earlier RBM Consultoria Mineral), who filed transfer requests of the granted exploration permits to its sole owner, Rodrigo de Brito Mello. The application cannot be transferred until the permit is published, however Rodrigo and RBM Consultoria Mineral will undertake contractual obligations to transfer the title to Enova as soon as the permit is published in the official gazette. Details of the CODA tenements are provided in the following table.

Table 2: CODA Project tenements Minas Gerais, Brazil

ATTRACTIVE BUSINESS ENVIRONMENT

Brazil has well developed and sophisticated mining industry, and is amongst the leading exporters of iron ore, tin, bauxite, manganese, copper, gold, rare earth and lithium. The sovereign investment risk is low, and business environment is secured, based on:

- Mining is recognised as a key economic industry in Brazil and the State of Minas Gerais.
- Progressive mining policies, seeking investment, encouraging explorers and new developments,
- Mining investment free of government mandated ownership,
- Low sovereign risk and government interference,

- Attractive cost base and sophisticated support network for the mining industry
- High level of exploration/mining technical skills and expertise in country
- Excellent infrastructure is in place and practical proximity to cities

MANAGING OUR COMMITMENTS

Enova is currently focussed on the exploration drilling program at the CODA project. Enova also remains committed to the development of Charley Creek rare earth project with metallurgical process improvement test work continuing in Brisbane.

The Company will also continue to review projects and business opportunities as they arise.

The market will be kept apprised of developments, as required under ASX Listing Rules and in accord with continuous disclosure requirements.

Approved for release by the Board of Enova Mining Limited

Competent Person Statement

The information related to Exploration Targets and Exploration Results is based on data compiled by Subhajit Deb Roy, a Competent Person and Chartered Member of The Australasian Institute of Mining and Metallurgy. Mr Deb Roy is currently working as Exploration Manager with Enova Mining. Subhajit has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Subhajit consents to the inclusion in presenting the matters based on his information in the form.

Forward-looking statements

This announcement contains forward-looking statements which involve several risks and uncertainties. These forward-looking statements are expressed in good faith and believed to have a reasonable basis. These statements reflect current expectations, intentions or strategies regarding the future and assumptions based on currently available information. Should one or more of the risks or uncertainties materialise, or should underlying assumptions prove incorrect, actual results may vary from the expectations, intentions and strategies described in this announcement. No obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

Precautionary Statement

The information contained in this announcement regarding the exploration results at CODA North is based on data collected from diamond and reverse circulation (RC) drilling programs. While the identification of significant mineralised zones within the Patos formation of the Mata Do Corda Group suggests the potential for Rare Earth Element (REE) mineral resources, it is important to note the following cautionary considerations. The project is currently at an exploration stage, and while initial drilling results are promising, further exploration and evaluation are necessary to ascertain the extent, quality, and economic viability of the mineral resources. Potential mineralisation identified by sampling in drill holes is currently undergoing comprehensive assaying, mineralogical evaluation, structural analysis and metallurgical test work. Until these analyses are completed, surety of resource estimates in the future remains speculative.

Disclaimer

This ASX announcement (Announcement) has been prepared by Enova Mining Limited (“Enova” or “the Company”). It should not be considered as an offer or invitation to subscribe for or purchase any securities in the Company or as an inducement to make an offer or invitation with respect to those securities. No agreement to subscribe for securities in the Company will be entered into on the basis of this Announcement.

This Announcement contains summary information about Enova, its subsidiaries, and their activities, which is current as at the date of this Announcement. The information in this Announcement is of a general nature and does not purport to be complete nor does it contain all the information which a prospective investor may require in evaluating a possible investment in Enova.

By its very nature exploration for minerals is a high-risk business and is not suitable for certain investors. Enova’s securities are speculative. Potential investors should consult their stockbroker or financial advisor. There are many risks, both specific to Enova and of a general nature which may affect the future operating and financial performance of Enova and the value of an investment in Enova including but not limited to economic conditions, stock market fluctuations, commodity price movements, regional infrastructure constraints, timing of approvals from relevant authorities, regulatory risks, operational risks and reliance on key personnel.

Certain statements contained in this announcement, including information as to the future financial or operating performance of Enova and its projects, are forward-looking statements that: may include, among other things, statements regarding targets, estimates and assumptions in respect of mineral reserves and mineral resources and anticipated grades and recovery rates, production and prices, recovery costs and results, capital expenditures, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions; are necessarily based upon a number of estimates and assumptions that, while considered reasonable by Enova, are inherently subject to significant technical, business, economic, competitive, political and social uncertainties and contingencies; and, involve known and unknown risks and uncertainties that could cause actual events or results to differ materially from estimated or anticipated events or results reflected in such forward-looking statements.

Enova disclaims any intent or obligation to update publicly any forward-looking statements, whether because of new information, future events, or results or otherwise. The words ‘believe’, ‘expect’, ‘anticipate’, ‘indicate’, ‘contemplate’, ‘target’, ‘plan’, ‘intends’, ‘continue’, ‘budget’, ‘estimate’, ‘may’, ‘will’, ‘schedule’ and similar expressions identify forward-looking statements. All forward-looking statements made in this announcement are qualified by the foregoing cautionary statements. Investors are cautioned that forward-looking statements are not guarantee of future performance and accordingly investors are cautioned not to put undue reliance on forward-looking statements due to the inherent uncertainty therein. No verification: although all reasonable care has been undertaken to ensure that the facts and opinions given in this Announcement are accurate, the information provided in this Announcement has not been independently verified

| | | |
|-------------------------------------|--|---|
| | | <p>Patos formation.</p> <p>All samples were sent for preparation to the contracted laboratory, SGS Geosol in Vespasiano, MG, Brazil.</p> <p>The sample was homogeneously reduced by using riffle splitter and one part is sent for assaying, other part is stored and retained or returned to Patos De Minas as umpire sample.</p> <p>The tertiary undifferentiated detritus cover layer (Tertiary Sedimentary Cover; Refer Table 4) has been visually differentiated from kamafugite of Patos formation by professional geologist and additionally, magnetic susceptibility test carried out by Terraplus KT10-V2 device to differentiate the ferromagnetic iron bearing kamafugite litho-unit within Patos formation from overlying and underlying formations.</p> |
| <p>Drilling techniques</p> | <ul style="list-style-type: none"> • Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). | <p>Diamond Drillholes</p> <p>Diamond drilling was carried out by Maquesonda MACH 1210 rig, drilling vertically and sampled generally at intervals of 1.0m within the mineralised strata. The drilling used a wireline diamond core of HQ diameter of 2.63 inches (core diameter).</p> <p>Drilling of each hole was conducted by the diamond core rig and terminated upon intercepting between 1 to 10 meters of underlying Areado Group, indicative of penetration into the underlying unmineralised or less mineralised zone.</p> <p>Diamond Drill rig was demobilised after completing CODA North Drilling</p> <p>Reverse Circulation Drillholes</p> <p>RC drilling was conducted using with a 4.75-inch diameter downhole rigs.</p> <p>The drill site preparation included clearing, levelling the ground, and delineating the drilling area. The RC drilling was terminated upon intercepting between 1 to 10 meters of underlying Areado Group, indicative of penetration into the underlying unmineralised or less mineralised zone.</p> <p>Diamond drilling was predominantly used for establishing the extent of the ore body while RC drilling being used to test the continuity of mineralised zone between diamond drillholes.</p> |
| <p>Drill sample recovery</p> | <ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | <p>Recovery in Diamond Drillholes</p> <p>Estimated after each run, comparing the length of core recovery vs. drill depth by visual inspection. Overall core recoveries are above 90% in diamond drilling.</p> <p>Recovery in RC drillholes</p> <p>Every 1m sample in the mineralised strata is collected in plastic bags and weighed. Each sample averages approximately 6-12kg, which is considered given the hole diameter, material loss sticky clay content in the lithological units and the specific density of the material. The estimated sample recovery was initially above 50% due to high clay content in the strata, loss of drill cuttings and in the later drillholes the estimated recovery of drill cuttings improved up to 70%. The recovery</p> |

| | | |
|---|---|--|
| | | <p>has been estimated by visual inspection.</p> <p>Any sample bias due to low recovery will be determined after the assay and mineral characterisation are completed.</p> |
| Logging | <ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. | <p>Diamond Drillholes</p> <p>Lithological descriptions are carried out at site or in Enova’s warehouse facility by professional geologist, describing broadly about the pedolith, saprolite, SAP rock and underlying Areado group and the lithological contacts. Parameters such as grain size, texture, colour, mineralogy, magnetism, type of alterations (hydrothermal or weathering) will be logged in detail in due course. The type of lithological contact is identified by visual inspections and magnetic susceptibility readings which can help to differentiate the overlying and underlying lithology from mineralised zone.</p> <p>All drill holes are photographed and stored at the core facility in Patos De Minas.</p> <p>Reverse Circulation Drillholes</p> <p>A professional geologist logs the material at the drill site or in the Enova’s warehouse facility, describing broadly about the pedolith, saprolite, SAP rock and Areado group and the lithological contacts. Other parameters including grain size, texture, and colour, will be logged in detail in due course.</p> <p>Due to the nature of the drilling, sampling is done at 1m intervals within the mineralised zone. 1m samples weighing approximately 6-12kg are collected in a bucket and presented for sampling and logging. The average weight improved up to 15kg with increasing recovery of samples by preventing the loss of drill cuttings.</p> <p>The chip trays of all drilled holes have a digital photographic record and are stored at the Enova’s warehouse facility in Patos De Minas.</p> <p>A schematic north-south cross section is shown in Figure 5</p> |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all cores taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality, and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. | <p>Diamond Drillholes</p> <p>Collection and labelling: Samples of diamond cores are taken at 1.0m intervals from mineralised kamaugite lithological unit</p> <p>The cores are split longitudinally using a spatula for unconsolidated portions or using riffle splitter (Figure 8) and a rock-cutting saw for hard rock.</p> <p>The samples were placed in labelled plastic bags and in the process of dispatching to SGS Geosol laboratory in Vespasiano.</p> <p>Field Duplicates: Duplicates are inserted approximately every 20 samples using quarter core for QA/QC procedures</p> <p>Reverse Circulation (RC) Drillholes</p> <p>RC drillholes samples are currently sent to SGS Geosol Laboratory for preparation and subsampling. SGS Geosol laboratory follows industry standard protocols for sub-sampling procedure.</p> <p>The sample assays were conducted in the following method</p> <p>Sample Preparation in SGS Laboratory</p> <p>At the lab, SGS-Geosol commercial laboratory, in Vespasiano, the samples are dried at 60^o or 105^o C, 75% material crushed to a nominal</p> |

| <p>Verification of sampling and assaying</p> | <ul style="list-style-type: none"> • The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and | <p>Enova's professional geologist from Brazilian team, has reviewed the data collated and compared with electronic copies to verify the accuracy. Assay data, in electronic form, is checked to verify the data files are correctly handled in spreadsheets where calculations are needed. The process of verifying sampling and assaying is still ongoing as drilling progresses. Competent person also visited the site in September 2024 to verify the sampling process.</p> <p>This was a maiden drilling program by Enova. Hence, twinned holes</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| | | |
|--|---|--|
| | <p><i>electronic) protocols.</i></p> <ul style="list-style-type: none"> • <i>Discuss any adjustment to assay data.</i> | <p>were not drilled to verify the representation of historical drill data.</p> <p>2m or 4m or longer interval composite samples of the overburden strata of tertiary undifferentiated detritus and/or lateritised cover. 1m samples taken from the mineralised zone of kamafugite within Patos formation</p> <p>Field geological data was recorded on logs (Appendix 2 Table 4 and Table 4 are shown alongside the assay results) and typed into a spreadsheet for subsequent import to a database.</p> <p>Assay data is received in spreadsheet form from the laboratory</p> |
| Location of data points | <ul style="list-style-type: none"> • <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> • <i>Specification of the grid system used.</i> • <i>Quality and adequacy of topographic control.</i> | <p>The drill hole collars were picked up using a Garmin handheld GPS. Datum for all sitework is considered SIRGAS 2000, Zone 23 South or WGS 84 UTM Zone 23S (Appendix 1, Table 2). The error in the handheld GPS is around ±3m. A DGPS survey picks up of collar of all drill holes have been planned and will be implemented in next couple of months. This universal grid system facilitates consistent data interpretation and integration with other geospatial datasets.</p> |
| Data spacing and distribution | <ul style="list-style-type: none"> • <i>Data spacing for reporting of Exploration Results.</i> • <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> • <i>Whether sample compositing has been applied.</i> | <p>The average spacing between adjacent planned holes is about 400m x 400 m, varied according to the extent, width, and length of the tenements.</p> <p>Diamond drilling is to provide insights into lateral extent of the potential mineralised zones. The exploratory nature of the diamond drilling further supports the overall geological understanding. Hence, they are drilled at larger spacings 400m x 400m. However, the current holes are being drilled at the margin of the grid which put the holes apart by more than 400 m spacings.</p> <p>Reverse circulation (RC) drilling carried out on a structured grid with a 400 x 400 metres spacing. This grid pattern is tailored to enhancing the understanding of the mineral distribution, extent of mineralisation along strike and geological continuity across the target zone. The hole locations have been occasionally adjusted according to the outcome of intersects of mineralised zone in already drilled holes.</p> <p>2m or 4m or longer interval compositing was used to produce a sample for assay of unmineralised and less mineralised overburden zone (Tertiary Sedimentary Cover). No other compositing of samples done at this stage. The samples in the mineralised zone are done for every meter drill run.</p> <p>No resources are reported.</p> |
| Orientation of data in relation to geological structure | <ul style="list-style-type: none"> • <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> • <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered</i> | <p>Mineralisation is moderately flat lying. The drillholes are vertical, which is closely perpendicular to mineralised horizons.</p> <p>Vertical drillholes are considered appropriate due to the characteristics of the deposit. The deposit is saprolitised resulting in supergene enrichment. This kind of deposit is typically extended horizontally with a relatively less variable thickness and stratabound.</p> <p>There is no evidence that the drilling orientation has introduced any sampling bias regarding the critical mineralised structures. The drilling</p> |

| | | |
|---------------------------------|--|--|
| | <p><i>to have introduced a sampling bias, this should be assessed and reported if material.</i></p> | <p>orientation is well-aligned with the known geology of the deposit, ensuring accurate representation and unbiased sampling of the mineralised zones. Any potential bias due to drilling orientation is considered negligible in this context.</p> |
| <p>Sample security</p> | <ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> | <p>All samples were collected by qualified and skilled field geologists and meticulously packed in labelled plastic bags. They were then transported directly to the SGS-GEOSOL laboratory, Vespasiano, Minas Gerais in Brazil. The samples were secured during transit to prevent tampering, contamination, or loss. A chain of custody was maintained from the field to the laboratory, with proper documentation in spreadsheet and photos accompanying each batch to ensure transparency and traceability throughout the sampling process. Utilising a reputable laboratory further ensures the security and integrity of the assay results.</p> |
| <p>Audits or reviews</p> | <ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> | <p>The site is attended by Enova’s Brazilian Professional Geologists’ team to inspect drilling and sampling procedures, verify survey methods, inspect the storage shed, verification geological records, review QAQC procedures and review the geologic model. The competent person had audited and visited CODA project sites on 17 September 2024.</p> |

Section 2 - Reporting of Exploration Results

| Criteria | JORC Code explanation | Commentary |
|--|--|--|
| Mineral tenement and land tenure status | <ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | <p>The title holder of the tenements is now Rodrigo De Britto Mello (Earlier RBM Consultoria Mineral), who filed transfer requests of the granted exploration permits to its sole owner, Rodrigo de Brito Mello. The application cannot be transferred until the permit is published, however Rodrigo and RBM Consultoria Mineral will undertake contractual obligations to transfer the title to Enova as soon as the permit is published in the official gazette. Details of the CODA tenements are provided in the Table 2 and Figure 12.</p> <p>The drilling is completed in CODA North area consisting of tenements 831369/2020 and 831381/2020. The RC drilling is commenced in CODA Central consisting of 830699/2021 from 3 Oct 2024</p> <p>Enova has submitted the required fees and annual reports of the above tenements to ANM on and before 2 August 2024 and the renewal of the tenements is under process through to the next year.</p> |
| Exploration done by other parties | <ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. | <p>The CODA North area was earlier explored by Vicenza and the significant results of historical drilling of CODA North are announced via ASX release³ dated 18 March 2024. The historical data provides guidance for current exploration drilling.</p> <p>CODA Central project area was previously sampled under Regional Surface Geochemical sampling program⁴. However, no other party explored CODA Central.</p> |
| Geology | <ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. | <p>The prospective geological unit present in the CODA project areas including CODA North and CODA Central, is composed of the Patos formation. It formed during the Upper Cretaceous period, when a massive volcanic event occurred in the western part of Minas Gerais state. The volcanic activity exhibited both effusive (lava flows) and explosive (pyroclastic deposits) eruptions. The predominant rock type in this formation is kamafugite, which is classified as an alkaline-ultramafic rock. High-grade REE are also enriched in this formation.</p> <p>The prospective unit consists of a horizontal bed of kamafugite, which can be up to 40 metres thick, overlain by overburden that varies from 0 to 50 metres. Weathering processes with thick clay zones are prevalent throughout this profile, leading to the accumulation of REE closer to the upper part of the formation. The rocks within this formation are predominantly soft and friable, with an extremely fine particle size. These characteristics are considered advantageous for the exploration of Clay hosted REE deposits.</p> |

³ ASX announcement “World class clay hosted rare earth grades uncovered at CODA North” dated 18 March 2024

⁴ ASX Announcement “CODA Geochem. sampling reveals high-grade REE mineralisation” 15 Aug 2024

CDN-RC-0023 <p>All results are given in the table 4. The remaining assay results will be disclosed as soon as the evaluation of the data is completed.</p> |
| <p>Data aggregation methods</p> | <ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated. | <p>The data are being compiled in Collar, Survey, Assay and Geology files.</p> <p>The Assay data has been compiled in the Assay table and TREO and NdPr% are given in the Appendix C, Table 4. The database has been compiled as per industry standard practices and for the use of resource modelling in the next stage.</p> <p>The conversion of Total Rare Earth Oxide (TREO) will be calculated using standard conversion table as mentioned below.</p> <p>The conversion of elemental assay results to expected common rare earth oxide products, uses conversion factors applied relating to the atomic composition of common rare earth oxide sale products. The following calculation for TREO provides REE to RE oxide conversion factors and lists the REE included:</p> <p>TREO=</p> $(Ce*1.23) + (Dy*1.15) + (Er*1.14) + (Gd*1.15) + (Ho*1.15) + (La*1.17) + (Lu*1.14) + (Nd*1.17) + (Pr*1.21) + (Sm*1.16) + (Tb*1.18) + (Tm*1.14) + (Y*1.27) + (Yb*1.14)$ <p>For the reporting of significant intersections, the downhole aggregation</p> |

| | | |
|--|--|---|
| | | <p>for the cut-off calculation is based on the average of 3 consecutive samples that are greater than the nominal cutoff. No more than 3 samples below cut-off are accepted in any 3m consecutive aggregation but the aggregation with the below cut-off sample must remain above the nominal cut-off.</p> <p>Nominal cut-offs of 1000 ppm, 2000 ppm and 3000 ppm have been applied for calculation of significant results. Notable high-grade assays have been calculated with nominal cut-off 3000 ppm.</p> <p>A schematic cross section in North South direction is shown in Figure 5.</p> |
| <p>Relationship between mineralisation widths and intercept lengths</p> | <ul style="list-style-type: none"> • <i>These relationships are particularly important in the reporting of Exploration Results.</i> • <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> • <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> | <p>Due to the geometry of the mineralisation, the vertical orientation of the drill holes, the downhole lengths are likely to be close approximations of the true widths of the mineralised zones.</p> <p>In instances where discrepancies between downhole lengths and true widths may occur, it should be noted as "downhole thickness or length, not the true width".</p> <p>All drill holes are vertical and suitable for the deposit type, ensuring unbiased sampling of the mineralisation</p> |
| <p>Diagrams</p> | <ul style="list-style-type: none"> • <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | <p>The data provided in this report aids readers in comprehending the information more effectively. The document includes various diagrams and supplementary details, which enhance the clarity and accessibility of the geological findings and exploration results. Please refer to the Figure 1 to 9 for drilling, sampling related data and information and Figure 10 and 11 for drillhole locations in CODA North and CODA Central respectively.</p> |
| <p>Balanced reporting</p> | <ul style="list-style-type: none"> • <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> | <p>The data presented in this report aims to offer a transparent and comprehensive overview of the exploration activities and findings. It thoroughly covers information on sampling techniques, geological context, prior exploration work, and assay results. Relevant cross-references to previous announcements are included to ensure continuity and clarity. Diagrams, such as drillhole plan and tenements maps and tables, are provided to facilitate a deeper understanding of the data.</p> <p>Additionally, the report distinctly mentions the source of the samples, whether from saprolitic clays, kamafugite lithounits under Patos formation, to ensure a balanced perspective. This report represents the exploration activities and findings without any undue bias or omission.</p> |

| | | |
|--|--|---|
| <p>Other substantive exploration data</p> | <ul style="list-style-type: none"> • <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> | <p>There is no additional substantive, relevant and significant exploration data to report currently.</p> |
| <p>Further work</p> | <ul style="list-style-type: none"> • <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> • <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive</i> | <p>In the current stage, resource delineation drilling is focused on systematically mapping the extent and continuity of the mineralised zones identified during initial exploration. This involves both infill and step-out drilling to provide detailed information on the grade and distribution of the mineralised zones, reducing geological uncertainty and will improve the confidence and accuracy of the resource model in the next stage.</p> <p>As we move to the next stage, resource definition will take precedence, leading to a compliant mineral resource estimate.</p> <p>Diagrams and figures in the current document entail the future infill drilling requirement in the gaps to enhance the confidence on geological, grade continuity and resource categorisation.</p> |

Table 4: Significant results of assays from drillholes (CDN-DD-16 to CDN-DD-19 and CDN-RC-0019 to CDN-RC-0023) of CODA North area

(The lithology from the log is preliminary will be validated in line with the assay outcome and visual inspection)

Abbreviations & Legend

CREO = Critical Rare Earth Element Oxide

HREO = Heavy Rare Earth Element Oxide

IAC = Ion Adsorption Clay

LREO = Light Rare Earth Element Oxide

REE = Rare Earth Element

REO = Rare Earth Element Oxide

TREO = Total Rare Earth Element Oxides including Yttrium Oxide

NdPr% = Percentage amount of neodymium and praseodymium oxides as a proportion of the total amount of rare earth oxide

wt% = Weight percent
