

Gold Mountain Limited (ASX:GMN)

Significant Lithium Anomalies Identified at Bandarra-São Braz Project

Gold Mountain Limited (ASX: GMN) ("Gold Mountain" or "the Company" or "GMN") is excited to announce it has received 61 stream sediment samples from the Bandarra-Sao Braz Project in Brazil.

Highlights

Work Undertaken

- Strongly clustered anomalous Lithium assays received from regional stream sediment sampling with peak values of 76 ppm lithium in NNE trend, parallel to regional structure.
- High potential for lithium bearing LCT pegmatites with strongly correlated Rb, Cs, Sn, Tl and Be.
- Two major anomalies, one over 7.5 km and the second over 1.9 km within tenements.
- Artisanal mines for feldspar and aquamarine (beryl) present in the larger anomaly area.

Future Workplan

- Mapping of exposures in drainages, infill stream sediment sampling followed by grid soil sampling will be undertaken to define the sources of the high order stream sediment anomalies.
- Drill targets will be the anticipated outcome of work undertaken.

David Evans, Managing Director, commented "The latest set of results have laid solid foundations for our ongoing exploration program at the Bandarra-São Braz Project, and I'm genuinely excited about what lies ahead for Gold Mountain in 2025. With a strong pipeline of large lithium, rare earth, and copper targets in emerging mining hotspots, the future looks very promising."

Details

Significantly anomalous stream sediment sample results that were strongly clustered were found on two of the Bandarra-São Braz tenements.

Catchment areas for each anomalous sample were defined on 5 metre contoured DTM and coloured to indicate magnitude.

The combination of strongly anomalous lithium results within the Bandarra-São Braz tenements associated with a major structural zone, the Portalegre Shear Zone, is highly encouraging.

The lithium results are strongly correlated with a series of LCT pegmatite pathfinder elements including Cs, Tl, Sn and Rb. Table 1 shows the correlation chart for the Bandarra-São Braz samples.

Images & Maps

Figure 1 shows the location of the Bandarra-São Braz Project tenements in relation to Major structural zones in the Borborema Province

Figure 1. Location of the Bandarra-São Braz Project tenements in the Borborema Province on the radiometric KUT image of the Borborema Province.

For personal use only

Major structural zones are very often the focus for late stage intrusive activity, and in the Borborema Province, are associated with the lithium producing areas of the Serido Belt and the past producing area around Solonopole.

Figure 2 shows the anomalous lithium catchments found in the Bandarra-São Braz Project tenements.

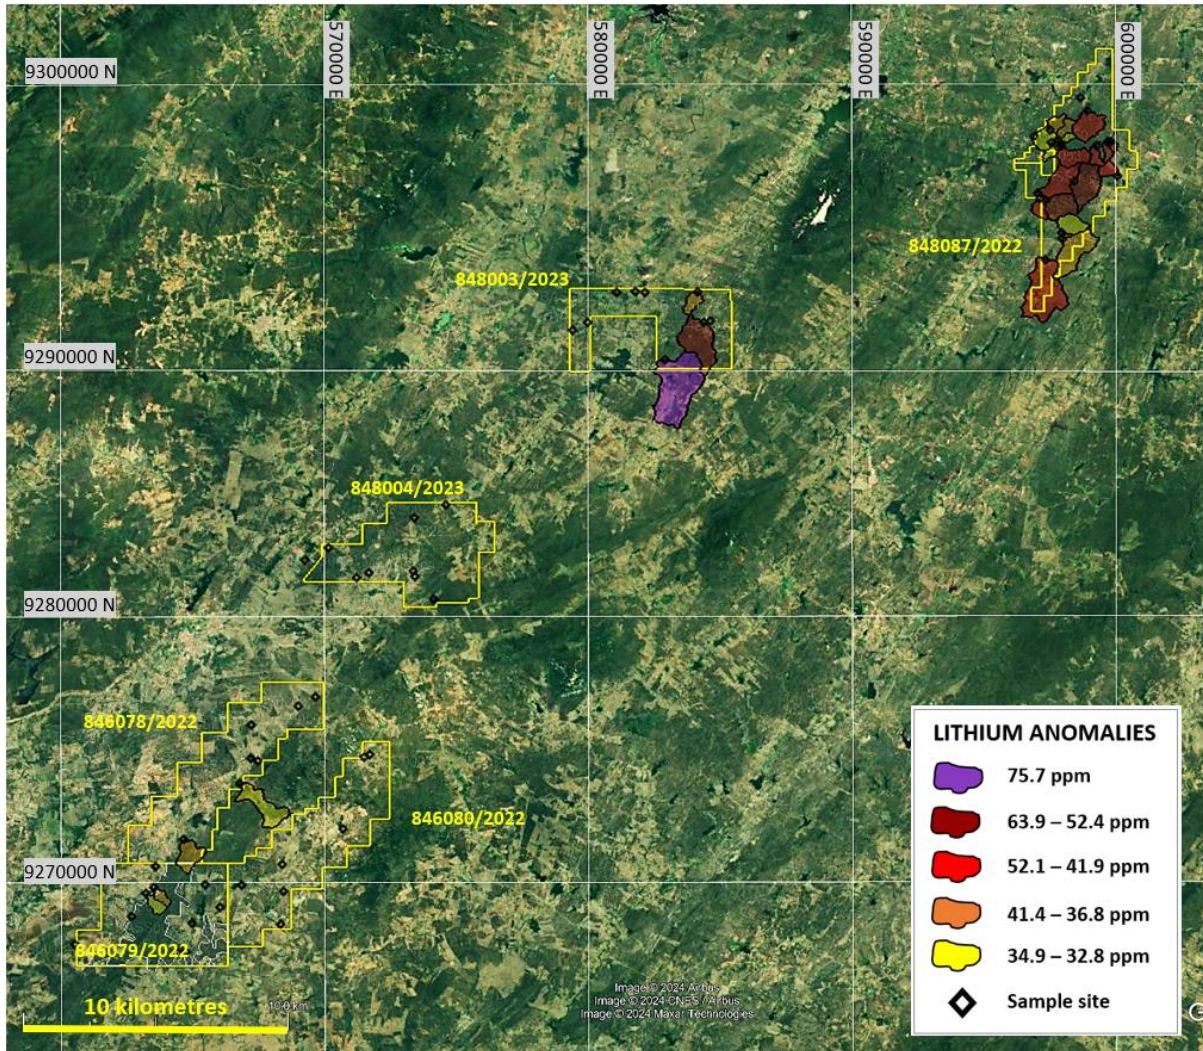

Figure 2. Lithium anomalies are plotted as anomalous catchments indicates the large prospective area that is present, particularly in the northern tenement, 848087/2022.

Previous artisanal mining has been carried out for amazonite, feldspar, emerald, beryl and aquamarine, a gem quality variety of beryl.

For personal use only

Figure 3 shows the CPRM recorded mineral occurrences of mineralisation in the Bandarra-São Braz Project tenements and surrounding areas.

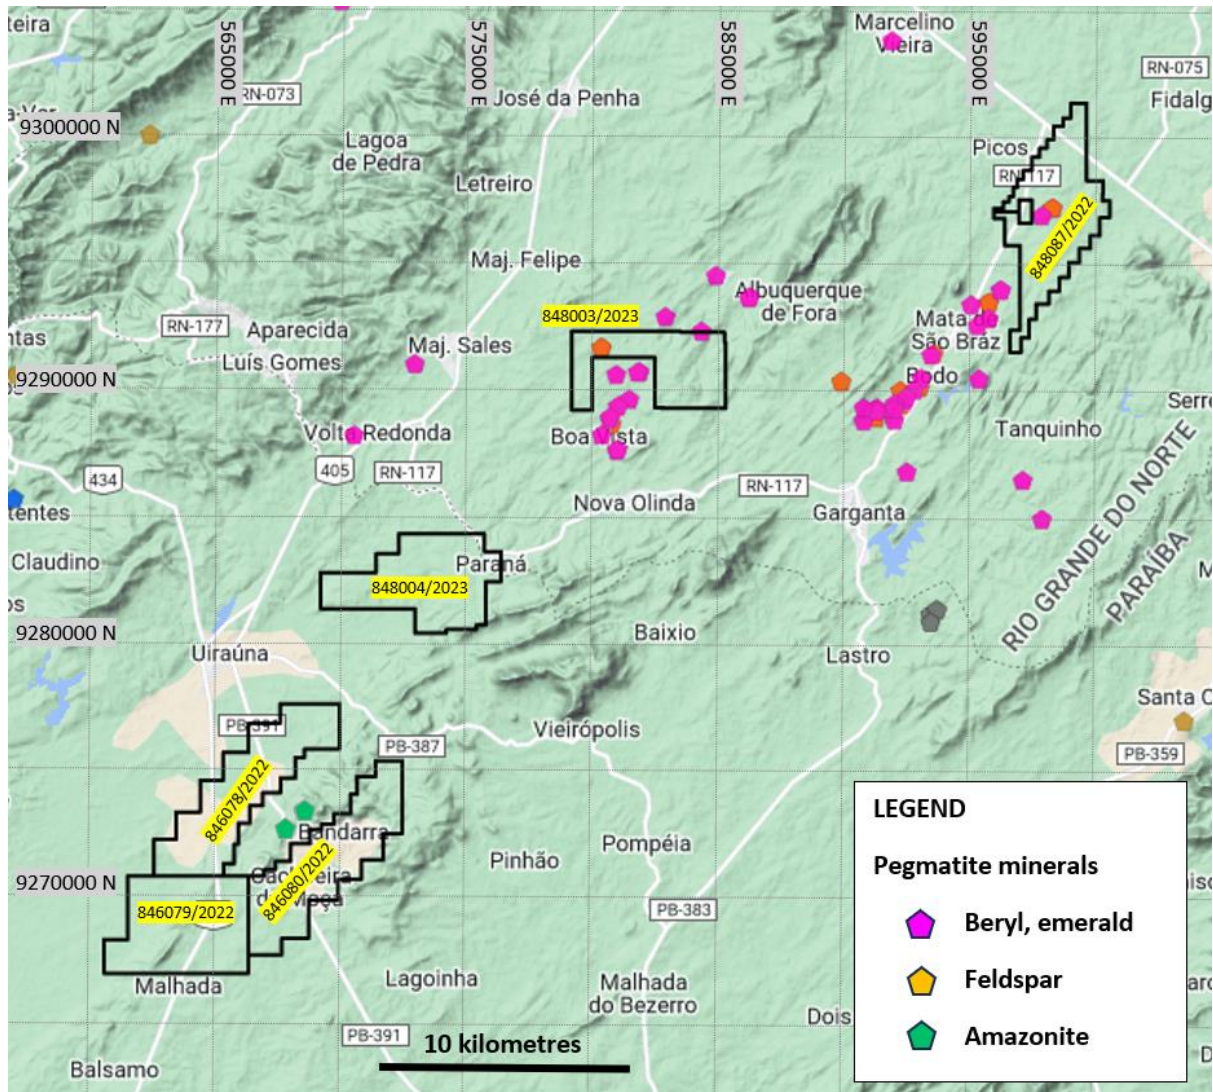

Figure 3. Pegmatite mineral occurrences in the Bandarra-Sao Braz region. Regional structural strike is evident in alignment of topography in the regional scale splay shear zone in the tenements region.

Mapping of occurrences of pegmatite and the rock types present is routinely carried out during stream sediment sampling. A total of 111 points were mapped where geological observations took place.

For personal use only

Figure 4 shows the location of the geological summary of points recorded indicating the widespread pegmatite locations observed.

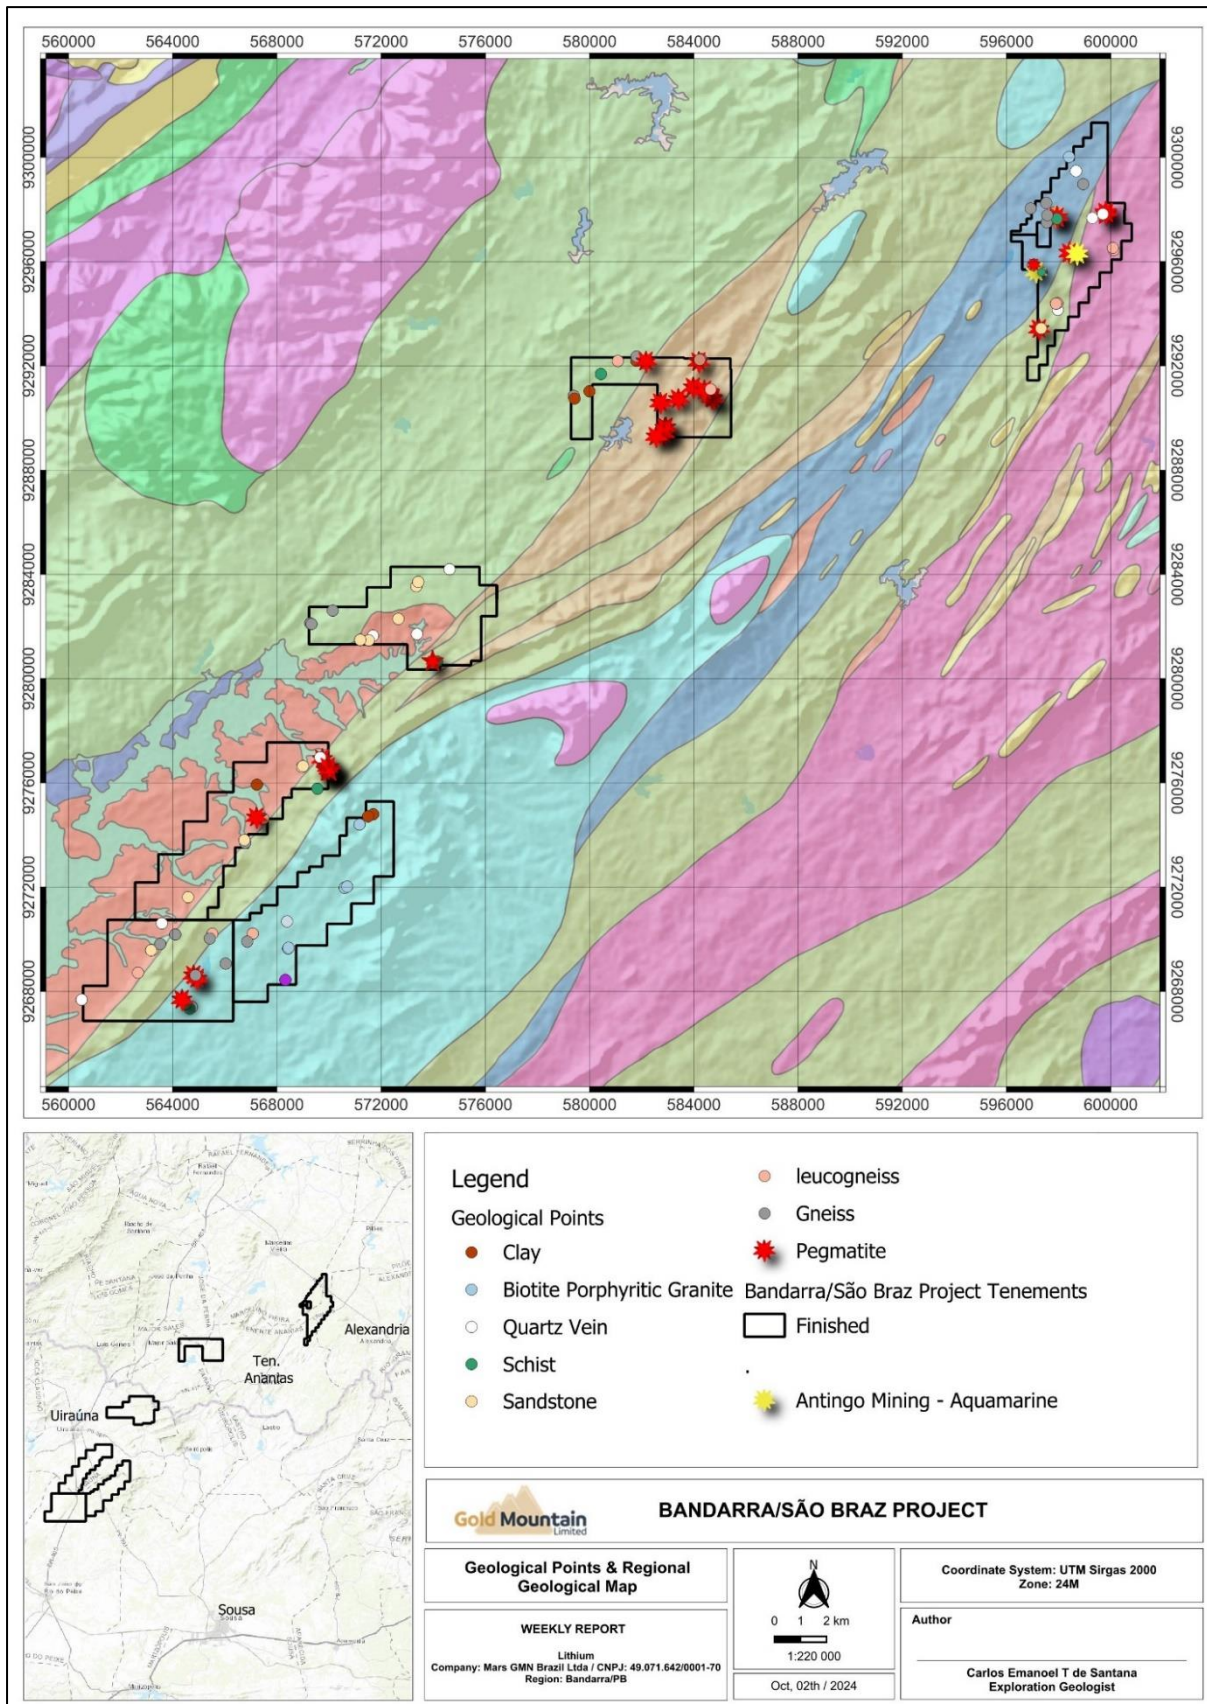

Figure 4. Locations at which pegmatites were found during regional stream sediment sampling.

For personal use only

Mapping was not the primary purpose of the work and the pegmatites found are considered to be a small proportion of what are likely to be present. Maximum widths of pegmatite found during stream sediment sampling was approximately 7 metres.

Competent Persons Statement

The information in this ASX release is based on information compiled by Peter Temby, a Competent Person who is a Member of Australian Institute of Geoscientists. Exploration results are included in this announcement including mapping done as a part of stream sediment sampling programs. Peter Temby is an independent consultant working currently for Mars Mines Ltd. Peter Temby confirms there is no potential for a conflict of interest in acting as the Competent Person. Peter Temby has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Peter Temby consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

About Us

Gold Mountain (ASX:GMN) is a mineral explorer with projects based in Brazil and Papua New Guinea (PNG). These assets, which are highly prospective for a range of metals including rare earth elements, niobium, lithium, nickel, copper and gold, are now actively being explored.

Gold Mountain has gradually diversified its project portfolio. The Company has highly prospective rare earth elements (REE), niobium, copper and lithium licenses located within the eastern Brazilian lithium belt, spread over parts of the Borborema Province and São Francisco craton in north-eastern Brazil including in Salinas, Mines Gerais.

In PNG, Gold Mountain is exploring the Wabag Project, which covers approximately 950km² of highly prospective exploration ground in the Papuan Mobile belt. This project contains four major targets, Mongae Creek-Monoyal, Sak Creek, Mamba Creek and Mt Wipi,, all lying within a northwest-southeast striking structural corridor. The four prospects have significant potential to host a porphyry copper-gold-molybdenum system and, or a copper-gold epithermal or skarn system. Gold Mountain's current focus is Mongae Creek-Monoyal, which has been subjected to several phases of exploration, and the potential to host a significant copper-gold deposit is high. The current secondary targets are, in order of priority, Lombokai, Sak Creek, Mt Wipi, and Mamba Creek, a new target, which sampling suggests is a porphyry centre, possibly similar to Mongae Creek-Monoyal.

Gold Mountain has also applied for a total of 1,048 km² in two exploration licences at Green River where high grade Cu-Au and Pb-Zn float has been found and porphyry style mineralisation was identified by previous explorers. Intrusive float, considered to be equivalent to the hosts of the

majority of Cu and Au deposits in mainland PNG, was also previously identified. One tenement has been granted; the other is waiting for Mining Wardens hearings with local villagers to determine if the tenement will be granted.

Appendix 1 JORC Code, 2012 Edition – Table 1

Section 1 - Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

| Criteria | JORC Code Explanation | Commentary |
|-----------------------------------|---|---|
| <p><i>Sampling techniques</i></p> | <ul style="list-style-type: none"> ▪ <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> ▪ <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> ▪ <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> ▪ <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> | <ul style="list-style-type: none"> ▪ <i>Stream sediment sampling was carried out in drainages over 500 metres long with spacing planned at approximate 1 km on drainages.</i> ▪ <i>Stream sediment samples weighed approximately 1 kg each. Sample is pre-processed to a -10 micron sample fraction that is submitted to the laboratory.</i> ▪ <i>Samples are not considered representative of the possible grade of mineralisation at depth however they are considered to well represent the metals that are attached to clays, fine iron oxides and micaceous minerals as the fine fraction used is better able to travel in low gradient catchments than coarser fractions.</i> ▪ <i>The size fraction is representative of the geochemistry of the catchment.</i> ▪ <i>Analytical procedures are industry standard 2 acid digest and ICP analysis with very low detection limits.</i> |
| <p><i>Drilling techniques</i></p> | <ul style="list-style-type: none"> ▪ <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether</i> | <ul style="list-style-type: none"> ▪ <i>No drilling undertaken</i> |

For personal use only

| Criteria | JORC Code Explanation | Commentary |
|--|---|--|
| | <p><i>core is oriented and if so, by what method, etc).</i></p> | |
| <p><i>Drill sample recovery</i></p> | <ul style="list-style-type: none"> ▪ <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> ▪ <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> ▪ <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> | <ul style="list-style-type: none"> ▪ <i>No drilling undertaken</i> ▪ <i>Samples are considered representative due to the fine grain size and taking the sample in active channels.</i> ▪ <i>Sample recovery and grade relationships are not relevant to the type of stream sediment fraction targeted in the stream sediment samples</i> |
| <p><i>Logging</i></p> | <ul style="list-style-type: none"> ▪ <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> ▪ <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> ▪ <i>The total length and percentage of the relevant intersections logged.</i> | <ul style="list-style-type: none"> ▪ <i>No drilling undertaken</i> ▪ <i>Stream sediment sampling is subjective however the fraction sampled and the preparation and analytical procedures used make the samples readily compared and more representative than -80 # samples.</i> ▪ <i>All sample data including stream size and associated lithologies in the stream are recorded on site.</i> ▪ <i>Data recorded is quantitative for location and stream width and qualitative for any percentages of lithologies present as gravel.</i> |
| <p><i>Sub-sampling techniques and sample preparation</i></p> | <ul style="list-style-type: none"> ▪ <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> ▪ <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> ▪ <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> ▪ <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> ▪ <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for</i> | <ul style="list-style-type: none"> ▪ <i>No drilling undertaken</i> ▪ <i>All samples were collected at 1 kg bulks in the field, screened at approximately 2.5 mm then securely packaged and taken to the GMN sample preparation laboratory.</i> ▪ <i>Sample preparation undertaken by GMN prior to sample dispatch to ALS at Belo Horizonte was to separate the sample in an apparatus using Stokes Law to produce a nominal -10 micron fraction for dispatch to the lab after drying. Samples are dried in a low temperature drying cabinet.</i> ▪ <i>Sample representativity of the catchment was well represented in the -10 micron samples as this size fraction will travel over low gradient surfaces better than coarser fraction samples.</i> |

For personal use only

| Criteria | JORC Code Explanation | Commentary |
|--|---|---|
| | <p><i>instance results for field duplicate/second-half sampling.</i></p> <ul style="list-style-type: none"> ▪ <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> | <p><i>No duplicates are collected in the field however residues from extraction of the clay fraction are retained to ensure a repeat analysis could be performed if required.</i></p> |
| <p><i>Quality of assay data and laboratory tests</i></p> | <ul style="list-style-type: none"> ▪ <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> ▪ <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> ▪ <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> | <ul style="list-style-type: none"> ▪ <i>Sample preparation at the ALS lab is to pulverise the -10 micron sample, screen at -80# and analyse by the selected method required.</i> ▪ <i>The analytical techniques used are two acid digest and ICP-MS, the 2 acid digest method is a partial digest technique, compared to fusion digests and then ICP-MS, however differences in the analytical values of certified reference materials by the two methods suggest that 2 acid digests are suitable for non-resource sampling in exploration work. ALS codes used were ME-MS41L.</i> ▪ <i>No standards duplicates or blanks accompany these initial samples that will not be used other than to indicate potentially interesting element contents of the variably weathered samples</i> ▪ <i>Checks of the analytical values of CRM's used by the laboratory against the CRM specification sheets were made to assess whether analyses were within acceptable limits</i> |
| <p><i>Verification of sampling and assaying</i></p> | <ul style="list-style-type: none"> ▪ <i>The verification of significant intersections by either independent or alternative company personnel.</i> ▪ <i>The use of twinned holes.</i> ▪ <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> ▪ <i>Discuss any adjustment to assay data.</i> | <ul style="list-style-type: none"> ▪ <i>No drilling or drill hole samples analysed</i> ▪ <i>No twin holes drilled</i> ▪ <i>No verification will be undertaken for these initial samples, which will not be used in any resource estimate. The samples are to determine the levels of Li and other valuable elements in stream sediment samples</i> ▪ <i>All field data is checked upon entry into spreadsheets and storage in the company data base.</i> ▪ <i>No adjustments are made to assay data except to plot below detection as half detection limit and over limit as the value of maximum detection.</i> |

For personal use only

| Criteria | JORC Code Explanation | Commentary |
|---|--|--|
| <p><i>Location of data points</i></p> | <ul style="list-style-type: none"> ▪ Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. ▪ Specification of the grid system used. ▪ Quality and adequacy of topographic control. | <ul style="list-style-type: none"> ▪ Data points are measured by hand held Garmin 65 Multiband instruments with accuracy to 3 metres ▪ Grid system used is SIRGAS 2000 which is equivalent to WGS84 for hand held GPS instruments ▪ Elevations are measured by hand held GPS and are sufficiently accurate for this stage of exploration. ▪ Stream sediment sample sites are measured by hand held Garmin 65 multiband instruments with 3 metre accuracy in open conditions. |
| <p><i>Data spacing and distribution</i></p> | <ul style="list-style-type: none"> ▪ Data spacing for reporting of Exploration Results. ▪ Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. ▪ Whether sample compositing has been applied. | <ul style="list-style-type: none"> ▪ Stream sediment sampling was carried out at approximately 1 km intervals on drainages over 500 metres long. ▪ No sample compositing was undertaken. ▪ Samples are not used for estimation of grade. |
| <p><i>Orientation of data in relation to geological structure</i></p> | <ul style="list-style-type: none"> ▪ Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. ▪ If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | <ul style="list-style-type: none"> ▪ No drilling undertaken. ▪ Many streams are controlled by regional structure which may also control mineralisation and may bias results to some degree. The close spacing of samples and the grain size of the sample submitted for analysis is thought to have removed much of the potential bias that may be present. |
| <p><i>Sample security</i></p> | <ul style="list-style-type: none"> ▪ The measures taken to ensure sample security. | <ul style="list-style-type: none"> ▪ Stream sediment samples are taken to the GMN laboratory daily and kept under secure conditions. ▪ Prepared samples are securely packed and dispatched to ALS by reliable couriers or hand delivered by GMN personnel. |

For personal use only

| Criteria | JORC Code Explanation | Commentary |
|-------------------|--|---|
| Audits or reviews | <ul style="list-style-type: none"> ▪ <i>The results of any audits or reviews of sampling techniques and data.</i> | <ul style="list-style-type: none"> ▪ <i>Reviews of stream sediments sampling are undertaken in the field at irregular intervals by senior staff and new employees are trained by field crew in sampling techniques prior to working independently.</i> |
