

# **Aircore Drilling Across Northern Target area**

Extensive geochemical anomaly delineated at "The Shadows"

# **HIGHLIGHTS**

- First batch (**781** samples of 4,273 submitted) of Aircore assay results delineate coherent high-grade Au-As anomaly 1.4km in strike and up to 200m in width, grades up to 1.5 g/t Au, and open along strike at The Shadows Prospect
- New geochemical zone "Apache" not previously identified 300m west of The Shadows associated with a Dolerite intrusive and represents a new mineralised corridor parallel to "The Shadows" mineralised zone
  - RC drilling campaign also now complete with final samples to be dispatched this week

Queensland focused gold explorer, Pacgold Limited (ASX: PGO) ('Pacgold' or 'the Company') is pleased to announce first assay results for the regional Aircore drill campaign at the Company's 100% owned Alice River Gold Project ('the Project'), 300km northwest of Cairns, North Queensland.

A total of 781 Aircore samples have now been reported from the first submission, Aircore assays have delineated an outstandingly large and coherent gold-arsenic and antimony (Au-As and Sb) anomaly directly within the known geophysical corridor and extending for 1.4km of strike. Of significance is the discovery of a new interpreted parallel zone "Apache" 300m to the west of the Shadows main zone and on the western margin of the Alice River Fault Zone, this represents a repetition of the Shadows structure and new target zone for follow up RC drilling next season.

#### Pacgold's Managing Director, Matthew Boyes, commented:

"The scale of what we are only just starting to see here at Alice River is compelling, as shown by these first Aircore assays received for the "Shadows" area. Also of significance is the discovery of a new zone "Apache", sitting some 300m metres to the west of the known mineralised corridor and at the contact with a Dolerite intrusive and the main granite body generating new targets for follow up drilling".

"We have only received approximately 18% of all the samples dispatched and already delineated an additional large scale target zone in excess of 1.4km in strike and open at both ends, with some very high-grade results considering this is purely shallow Aircore and hasn't drilled any primary unleached mineralised material. This bodes well for an extensive RC drilling program planned to be undertaken in 2025."

**PACGOLD** 

**Figure 1:** Au assays in Aircore programme at "The Shadows" delineates consistent mineralisation corridor over 1.4km in strike with new parallel zone previously unidentified. RC collars shown are recently completed with samples now in the laboratory.

Figure 2: Sat image of Alice River project area with all completed

#### **Aircore Drilling**

As previously reported, the regional aircore drilling program was completed in early December and covered approximately 14km of interpreted strike of the Alice River Fault zone (ARFZ) IP resistivity low corridor. All samples generated from the program have been submitted for laboratory analysis, with assays returned for 95 of 749 holes, all from the Northern Target (Figure 1).

The Northern Target area contains no appreciable basement outcrop and is characterised by extensive granite-derived sand cover 0.5m to 2m in thickness. The Au-As-Sb geochemical anomalism is generated from weathered to semi-fresh granite and dolerite basement containing visible hydrothermal alteration and quartz veining similar in nature to that observed at the Central and Southern Targets.

The aircore drilling has defined two significant geochemical anomalies to date at the Northern Target. 'The Shadows' Prospect is a consistent linear zone of Au-As-Sb anomalism with an interpreted strike Hength in excess of 1.4km and up to 250m wide, and open to the north and south. The most southerly drill section with assay results on The Shadows reports the highest grades and thickest widths of alteration and Au-As-Sb mineralisation associated with zones of quartz veining.

The 'Apache' Prospect is located 300m to the west of The Shadows and is a gold anomaly defined by 5 aircore holes, including 2 holes with greater than 1g/t Au intersections. Apache is interpreted at this point to be parallel to The Shadows and is located on a marked inflection on the western margin of the IP Resistivity low corridor (Alice River Fault Zone), interpreted to be spatially related to intrusive mafic units (Figure 1).

The majority of the results for the 7,185m Aircore programme are still pending and cover the Central,

rity of the results Victoria and Jerry anomalies.

### **Reverse Circulation (RC) Drilling**

The RC drilling program commenced on 6 November 2024 and has now been completed with a total of 24 holes for 3,191 metres completed on 4 prospect areas. The RC rig will remain on site over the wet season to be ready for startup in 2025, with follow-up drilling to be planned on the multiple Aircore targets identified in this campaign. PGO plans to drill throughout 2025.

Drilling has focussed on the interpreted northern extension on the F1A zone on the Central Target, the northern extension of the Peninsula King – Alice Prospects on the Southern Target, follow-up on the 2023 drilling on the Jerry Dodds Prospect, and first pass drilling of the new quartz vein zone on the Shadows Prospect (Figure 2).

Of note, the first pass RC drilling of six holes on two sections of the Shadows Prospect (Figure 1) beneath the Aircore results reported here all intersected significant downhole widths of quartz veining hosted by strongly altered granite, and containing disseminated and bladed pyrite-marcasite sulphides, directly below the highly anomalous Aircore results.

All RC sample assays are awaited and will be reported as soon as they become available.

Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuation. Assay information is expected to be received over the course of December 2024 and January 2025.

Details of the drill collars are presented in Appendix 1 and the JORC Table is presented in Appendix 2.

This announcement is approved by the Pacgold Limited Board of Directors.

# **About Pacgold Limited:**

Pacgold is an ASX-listed minerals exploration company (ASX: PGO) focused on the Alice River Gold Project situated at the northern end of the Northeast Queensland Mineral Province. This gold-rich Province contains several multi-million-oz gold deposits including Pajingo, Mt Leyshon, Kidston, and Ravenswood.

Pacgold has a 100% interest in the Alice River Gold Project, covering an historical high-grade goldfield and open pit mine with eight mining leases and five exploration permits over an area spanning 377km<sup>2</sup>.

Since establishment in 2021, Pacgold has completed more than 27,000m of drilling which has confirmed district-scale Competent Persons Statement opportunity.

The information in this announcement that relates to Exploration Results is based on, and fairly represents, information compiled or reviewed by Mr Geoff Lowe, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Lowe is the Company's Exploration Manager and holds shares and options in the Company. Mr Lowe has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Lowe consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

# **APPENDIX 2. JORC CODE TABLE 1**

**Section 1: Sampling Techniques and Data** 

CRITERIA	JORC Code explanation	Commentary
SAMPLING TECHNIQUES	Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	Sampling methods have included surface rock chip samples.  Geochemistry from rock chip samples is used semiquantitatively to guide further exploration and is not used for Mineral Resource estimation.  The accuracy of rock chip geochemistry is generally high, but these samples are often spot samples and generally not used in Mineral Resource estimation.  Diamond drilling (DD), Reverse circulation (RC) drilling and Aircore drilling (AC) was used to obtain samples for geological logging and assaying.  Aircore drilling was completed to sample shallow basement.  Reverse circulation drilling (precollars) was used to obtain 1m samples where veining is noted.  Diamond core was halved with a core saw through zones where aleation and veining were present and sampled at 1m intervals or at other intervals to match the veining and geology.  The drill holes were sited to test geophysical targets/surface geochemical targets as well as previous drilling results.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	No information is available documenting measures to ensure sample representativity for surface sampling methods and open hole percussion drilling methods. These methods are not used for Mineral Resource estimation.  1m to 3m AC samples were collected using a spear of samples collected from the drillholes.  1m RC samples were automatically split using a cyclone-mounted cone splitter. 3m RC samples were automatically split as 1m samples using a cyclone-mounted cone splitter, then manually composited to 3m samples using a riffle splitter. The splitter cleaned after each interval with a compressed air gun.  Core and RC samples were submitted to the laboratory and sample preparation consisted of the drying of the sample, the

**PACGOLD** 

CRITERIA	JORC Code explanation	Commentary
		entire sample being crushed to 70% passing 6mm and pulverized to 85% passing 75 microns in a ring and puck pulveriser. All samples are assayed for gold by 50g fire assay with AAS finish. Multielement analysis is completed using an ICP-MS analysis.
		Screen fire analysis is completed on zones which contain multiple visible gold occurrences. 1kg pulp wet or dry screened to 75 microns. Duplicate 30g assay on screen undersize. Assay of entire oversize fraction.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse	Economic gold mineralisation is measured in terms of parts per million and therefore rigorous sampling techniques must be adopted to ensure quantitative, precise measurements of gold concentration. If gold is present as medium – coarse grains, the entire sampling, sub-sampling, and analytical process must be more stringent.
	circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.	At Alice River, gold can be visible and therefore there may be inherent sampling problems. Procedures used to manage this problem are documented elsewhere in relevant subsections of this table.
DRILLING TECHNIQUES	Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).	RC drilling used a 5.5" face sampling RC hammer.  AC drilling used NQ-size face sampling AC blade.  Diamond drilling was all HQ or NQ3 (triple tube) drill diameter.  Some core holes were diamond tails using RC pre-collars, others are diamond drilled from surface.  Orientation gear (diamond drilling) – Electronic digital core orientation system  Survey Gear – Electronic digital north-seeking gyroscope
DRILL SAMPLE RECOVERY	Method of recording and assessing core and chip sample recoveries and results assessed.	For diamond core drilling core recoveries are measured by reconstructing core into continuous runs on an angle iron cradle for orientation marking. An average core recovery of greater than 98% has been achieved.  No additional measures were required as core recoveries are
		deemed to be high, and samples considered to be representative.  For RC and AC sample recoveries of less than approximately 80% are noted in the geological/sampling log with a visual estimate of the actual recovery. Very few samples were

CRITERIA	JORC Code explanation	Commentary
		recorded with recoveries of less than 80%. No wet RC samples were recovered.
		No relationship has been observed between sample recovery and grade.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Use experienced driller, appropriate drilling fluids and reputable drilling company
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No assessment has been completed to determine if there is a relationship between sample recovery and grade, and whether there is any potential for sample bias associated with the different drilling methods used to date.
LOGGING	Whether core and chip samples have been geologically and geotechnically logged to a level	Geological logging was carried out on all diamond core and RC and AC chips. This included lithology, alteration, sulphide percentages and vein per, AC centages.
5	of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	For diamond core structure type is recorded along with structural orientation data (alpha and beta measurements) where the drill core is orientated.
3		Geological logging of alteration type, alteration intensity, vein type and textures, % of veining, and sulphide composition.
5		All drill core and RC and AC chip trays are photographed.
	Whether logging is qualitative or quantitative in nature. Core (or	Logging of the core is both qualitative and quantitative in nature.
	costean, channel, etc) photography.	Photographs of rock chips are also collected
	The total length and percentage of the relevant intersections logged.	All drill holes are logged in full.
SUB-SAMPLING TECHNIQUES AND SAMPLE PREPARATION	If core, whether cut or sawn and whether quarter, half or all core taken.	All the core is half core sampled within zones of visible alteration. Where the core is orientated the left-hand side / half of the core is sampled so that the core orientation line remains in the core tray.
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	RC samples are split using a cyclone mounted rotary cone splitter 87.5%:12.5% on one metre samples. In zones where visual alteration is not present three metre sample composites are created using the one metre sample via a riffle splitter. Compressed air was used to clean the splitter after eachsample interval. Duplicated samples were collected in visual orezones and at a frequency of at least 1 in 20.

CRITERIA	JORC Code explanation	Commentary
		AC samples were collected with a spear of each sample on one metre samples and composited over the length of the basement rocks intersected.
	For all sample types, the nature, quality, and appropriateness of the sample preparation technique.	ALS Townville completed the analysis, and the samples preparation methods are considered appropriate.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	No sub-sampling is undertaken.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	Information is collected /logged regarding they type of sample collected (grab or channel)  Laboratory duplicate sampling has been completed for the Diamond RC and AC drilling.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	No formal assessment has been undertaken to quantify the appropriate sample size required for good quality determination of gold content, given the nature of the gold mineralisation.
QUALITY OF ASSAY DATA AND LABORATORY TESTS	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Rock chip samples collected by Pacgold were assayed by ALS Townsville and analysed by fire assay and AAS finish 50g charge. Multielement analysis was completed by four acid digest with ICP-MS finish.  Drill core RC and AC chips are analysed by ALS Townsville and analysed by fire assay and AAS finish 50g charge.  Multielement analysis is completed by four acid digest with ICP-MS finish.
_	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No geophysical tools, spectrometers, or handheld XRF instruments have been used to date to determine chemical composition at a semi-quantitative level of accuracy.
	Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of	Certified Reference Material (CRM's) standards and blanks are purchased from an external manufacturer, and these are inserted into the sample batches sent to the laboratory at a frequency of 1 in 15.

	CRITERIA	JORC Code explanation	Commentary
		accuracy (i.e., lack of bias) and precision have been established.	
	VERIFICATION OF SAMPLING AND ASSAYING	The verification of significant intersections by either independent or alternative company personnel.	No verification completed
		The use of twinned holes.	No twinned holes have been completed
/I II y		Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Pacgold has collated the drilling database and created the Alice River Gold Project Access database. This database was imported into Micromine 3d software and validated against old maps and data.  Pacgold collects all logging data in a digital format and the data is combined with project database. Logging data is checked and validated in Micromine 3d software.
)			Pacgold geologists have verified the digital database from the previous drilling reports and/or original laboratory reports.  Digital data has been compiled from quality scanned tables and plans included in the statutory reports.
2			Pacgold staff have completed field checks and confirmed the location of some drillhole collars and areas of prior gold mining with a standard GPS.
		Discuss any adjustment to assay data.	No adjustments to assay data have been made.
	LOCATION OF DATA POINTS	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	All PGO drill holes are surveyed using a DGPS to an accuracy (x,y,z) of <10cm.  Surface sample data is located using a GPS to an accuracy of +/-5m
		Specification of the grid system used.	The co-ordinate system used in the Pacgold database is MGA zone 54, GDA94 Datum.
		Quality and adequacy of topographic control.	Quality of the topographic control data is poor and is currently reliant on public domain data
	DATA SPACING AND DISTRIBUTION	Data spacing for reporting of Exploration Results.	Rock chips were collected where outcrop was present.
		Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve	There are no Mineral Resources or Ore Reserves.  The most densely drilled prospect is AQ. With further drilling, data spacing and distribution may support Mineral Resource estimation.

**ASX: PGO** info@pacgold.com.au +61 7 3778 6728

CRITERIA	JORC Code explanation	Commentary
	estimation procedure(s) and classifications applied.	
	Whether sample compositing has been applied.	All reported results are part of either 1m sample intervals or 3m composites as described above.
ORIENTATION OF DATA IN RELATION TO GEOLOGICAL STRUCTURE	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Rock chip samples were collected where outcrops were present. Often the quartz veins are more resistant and outcrop.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	No sampling bias has been identified in connection with the orientation of the drilling.
SAMPLE SECURITY	The measures taken to ensure sample security.	Samples are securely transported by Pacgold staff to a commercial transport Company who transport the samples to ALS Townsville.
AUDITS OR REVIEWS	The results of any audits or reviews of sampling techniques and data.	Pacgold has not completed a review of the actual sampling techniques, as this is not possible. Pacgold has reviewed company reports describing sampling techniques. Pacgold has reviewed and where practical validated the database it has complied.

**Section 2: Reporting of Exploration Results** 

CRITERIA	JORC Code explanation	Commentary
MINERAL TENEMENT AND LAND TENURE STATUS	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	Refer to Solicitor's report in Company's IPO Prospectus released to ASX on 6 July 2021.  The Alice River Gold Project is secured by 13 tenements, including 8 granted Mining Leases (MLs), and 5 Exploration Permits for Minerals (EPMs), for total of approximately 377 square kilometres.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	Refer to Solicitor's report in Company's IPO Prospectus released to ASX on 6 July 2021All tenements are in good standing.
EXPLORATION DONE BY OTHER PARTIES	Acknowledgment and appraisal of exploration by other parties.	Refer to IGR in Company's IPO Prospectus released to ASX on 6 July 2021. A summary of previous exploration and mining is presented below.
5		1903: Gold mining commenced at Alice River Gold Project.
		1903 – 1917: Production of 3,244 oz Au at grade of around 38 g/t Au.
		1987 – 1998: Cyprus, Beckstar, Golden Plateau, Goldminco and Subloo International completed regional geochemical sampling programs, rock chip sampling, RAB/auger drilling, airtrack drilling, ground magnetic surveys, IP and VLF-EM geophysical surveys, costeaning programs, and numerous drilling programmes (RC and diamond drilling). Several estimates of the tonnage and grade of mineralisation, not compliant with the JORC Code were made.
		1999 – 2000: A total of 2,745 oz gold was produced from 36,000 t of ore by Beckstar.
		2001: Beckstar entered Administration and Tinpitch acquired the project.
		2017: Spitfire entered a joint venture deal with Tinpitch and completed RC drilling.
		The historical drilling and trenching data from Posie have been included in the Pacgold database and assessed to determine the relevance of the information to the current drilling program. The accuracy of the positions of historical drillholes at Posie is not reliable in the database and therefore all Posie drillholes have

info@pacgold.com.au **ASX: PGO** +61 7 3778 6728

CRITERIA	JORC Code explanation	Commentary
		been removed from maps or cross sections in publicly released information.
GEOLOGY	Deposit type, geological setting, and style of mineralisation.	The Alice River Gold Project lies within the Alice-Palmer Structural Zone. Gold mineralisation is focused along regional northwest shear zones. The shear zones are largely hosted within the Imooya Granite, a pale grey to white mica-biotite leucogranite (commonly referred in the old reports as an adamellite), of the Siluro-Devonian Kintore Supersuite. At the north end of the Project area the shears intersect gneisses and schists of the Sugarbag Creek Quartzite, which forms the lower part of the Mesoproterozoic Holroyd Metamorphics.  Mineralisation is considered to be Intrusion Related Gold – epithermal style. The gold-bearing shear zones extend episodically for approximately 50 km strike length. Gold mineralisation is generally hosted in quartz veins, and minor quartz breccias, up to 10 – 15 m wide in places. Gold mineralisation is focused in linear zones up to 150 m strike length.  Gold occurs as both fine free gold in quartz or associated with arsenopyrite and stibnite. Green-white quartz-sericite-epidote alteration zones extend 50 – 70 m around the mineralised veins at some deposits but generally the quartz veins display narrow alteration selvages. The weathered (oxide) zones at surface are around 10 – 20 m deep.
DRILL HOLE INFORMATION	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:  Easting and northing of the drill hole collar.  Elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar.  Dip and azimuth of the hole.  Down hole length and interception depth.  Hole length.	Drill hole details completed and in progress are presented in Table 1
	If the exclusion of this information is justified on the basis that the information is not Material	Historical drilling and trenching data from Posie have been included in the Pacgold database and assessed to determine the relevance of the information to the current drilling program. The accuracy of the positions

CRITERIA	JORC Code explanation	Commentary
	and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	of historical drillholes at Posie is not reliable in the database and therefore all Posie drillholes have been removed from maps or cross sections in publicly released information.
DATA AGGREGATION METHODS	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated.	Unless specified otherwise, a nominal 0.5g/t Au lower cut-off has been applied incorporating up to 4m of internal dilution below the reporting cut-off grade to highlight zones of gold mineralisation. Refer Table 1 and 2.  Broad lower grader zones described as mineralisation envelopes are reported using a 0.1g/t Au lower cut-off and incorporating up to 6m of internal dilution below the cut-off grade and results are shown in brackets and italics e.g. (50m @ 0.8g/t Au)  No metal equivalent values have been used for reporting exploration results.  To date PacGold have previously been reporting intercepts at 0.3 g/t Au and more recently at 0.5 g/t Au as well as highlighting >10 g/t Au high grade zones. These cut-offs were selected to highlight the mineralisation results that occur as narrow higher-grade veins and broader mineralisation zones comprising minor veins and alteration zones. Near surface mineralisation presents as an open pit target where 0.3 to 0.5 g/t Au presents a reasonable possible economic cut-off for bulk mining. However more recent deeper drilling by PacGold is leading into areas where underground mining is expected. Such mining might target both the narrow high-grade zones or allow larger scale bulk stoping underground mining methods. PacGold is still drill testing the extent of the mineralisation and continuity of the high-grade veins and broader mineralisation zone to determine the most likely open pit to underground interface and also the scale and likely cut-off for potential underground mine development. It is expected that exploration reporting cut-offs and criteria will be refined when these development aspects become clearer or after the initial Mineral Resource assessment refines the cut-off and thickness selections.
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of	High grade gold intervals internal to broader zones of mineralisation are reported as included intervals. A nominal 10g/t Au cut-off has been applied to reporting high grade gold intervals contained within broader zones of mineralisation. These are routinely specified in the summary results tables.

CRITERIA	JORC Code explanation	Commentary
	such aggregations should be shown in detail.	
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalents are reported.
RELATIONSHIP BETWEEN MINERALISATION WIDTHS AND INTERCEPT LENGTHS	These relationships are particularly important in the reporting of Exploration Results.	The orientation of the drilling is generally perpendicular to the strike of the mineralisation but not perpendicular to the dip on the mineralisation. Generally, the true width of the mineralisation is approximately half the
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	intercept width but until we have additional drilling to confirm the exact geometry of the mineralisation the true width is uncertain.
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').	
DIAGRAMS	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	See body of this ASX announcement for appropriate diagrams.
BALANCED REPORTING	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Comprehensive reporting of the drill hole information has been included. Quartz vein intersections from 23m to 27m, and 32m to 40m in samples from drillhole SHDH012 were identified to demonstrate the quartz veining evident in select samples but are not asserted to be representative of the drilling conducted to date.
OTHER SUBSTANTIVE EXPLORATION DATA	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results;	The Alice River Gold Project includes a large amount of exploration data collected by previous companies, including regional stream sediment geochemical data, soil sample and rock chip data, geological mapping data, open hole percussion drilling data, ground magnetics, IP and VLF-EM geophysical survey data, and costean data.

CRITERIA	JORC Code explanation	Commentary
FURTHER WORK	bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	Much of this data has been captured and validated into a GIS database.  Metallurgical tests of selected mineralised samples including bottle roll cyanide leach tests were conducted by Golden Plateau in 1994, Goldminco in 1999, and by Tinpitch in 2005 and 2006. Gravity concentration tests were also carried out by Goldminco in 1999. Bottle roll cyanide leach testing work produced variable results. Some samples returned low recoveries, whilst other samples produced high recoveries up to 90%. Further metallurgical work is warranted.  Further information is in the IGR of the Company's IPO Prospectus released to ASX on 6 July 2021.
	The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).	Pacgold plans to conduct further surface geological mapping and geochemistry, ground geophysics and Aircore, RC and Diamond drilling across three high-priority target areas over the next two years.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	See body of this ASX announcement.
