

DREADNO

Robust Scoping Study for Star of Mangaroon - Mangaroon Au (100%)

HIGHLIGHTS (all amounts are in A\$ unless otherwise stated)

- Initial production target of ~20koz @ 10g/t Au. The Star of Mangaroon remains open along strike and at depth. As such, the initial production target is subject to expansion from extensional drilling.
- Ore processing agreement (non-binding) in place with Black Cat Syndicate Ltd. ("Black Cat") to process Star of Mangaroon material at the Paulsens processing facility.
- Robust financials at \$4,100oz include:
 - Maximum cash drawdown of ~\$10.2M
 - All-in Sustaining Cost ("AISC") of \$1,800/oz
 - Operating Cashflow after all Capital and Tax ("Operating Cashflow") of ~\$40.1M
 - 87% Indicated Resource
- Detailed mine studies are well advanced, with approvals and early contractor engagement underway for potential commencement in 2025.

Dreadnought Resources Limited ("Dreadnought") is pleased to announce a scoping study for an initial open pit at Star of Mangaroon, part of the 100% owned Mangaroon Gold Project, located in the Gascoyne region of Western Australia.

Dreadnought's Managing Director, Dean Tuck, commented: "The initial scoping study for Star of Mangaroon highlights the opportunity that the high grade, near surface mineralisation at the Star of Mangaroon presents and forms the foundation of our strategy to become a self-funded explorer.

With the scoping study delivered, Dreadnought will seek to advance discussions with third parties to outsource funding, development, haulage & processing to generate cashflow. The cashflow from this operation would present a major milestone for Dreadnought and our shareholders as the proceeds could be used to fund future exploration and potentially return capital to our shareholders.

The favourable outcome of the initial scoping study justified completing the required baseline studies to progress approvals ahead of potential open pit mining. With gold prices continuing to climb, there could be no better time to bring a high-grade gold asset into production.

In parallel with our efforts to get the Star of Mangaroon into production this year, we will aggressively pursue opportunities to add resource ounces on our five granted mining leases with an aim to extend production and operations. We see potential to extend the Star of Mangaroon along strike and at depth, as well as following up high grade near surface intercepts at Popeye and undertake targeted drilling at Pritchard's, the Lead Gold Mine and Two Peaks. These existing mining leases provide short term pathways to extending operations.

For the medium and long term, our team will continue the low cost, high impact target generation and definition work at our Bordah and High Range camp scale prospects with the aim of delivering a major gold discovery.

We believe that Dreadnought is now well positioned to take advantage of its gold opportunities while still providing significant leverage and optionality for our shareholders with our critical metal and base metal assets also at Mangaroon. We look forward to 2025 and delivering on our self-funded explorer strategy."

Cautionary Statement – Scoping Study

The January 2025 Scoping Study ("the Study") has been prepared to ascertain whether a business case can be made before proceeding with more definitive studies of Star of Mangaroon's viability. The Study is a preliminary technical and economic assessment of the potential viability of Star of Mangaroon.

The Study is based on low level technical and economic assessments that are not yet sufficient to support the estimation of Ore Reserves. Further exploration and evaluation work and appropriate studies may be required before any estimate of Ore Reserves or to provide any assurance of an economic development case.

The Study includes a production target comprising Indicated (87%) and Inferred Resources (13%). Investors are cautioned that there is a low level of geological confidence in Inferred Resources and there is no certainty that further drilling will result in the determination of Measured or Indicated Resources, or that a production target will be realised.

The Study is based on the material assumptions outlined in this announcement including assumptions about the availability of funding. While Dreadnought considers all the material assumptions to be based on reasonable grounds, there is no certainty that they will prove to be correct or that the range of outcomes indicated by the Study will be achieved.

To achieve the range of outcomes indicated in the Study, funding in the order of \$10.2M (maximum cash drawdown) will likely be required. Investors should note that there is no certainty that Dreadnought will be able to raise that amount of funding when needed. It is also possible that such funding may only be available on terms that may be dilutive to or otherwise affect the value of Dreadnought's existing shares.

It is also possible that Dreadnought could pursue other 'value realisation' strategies such as a sale, partial sale or joint venture of Star of Mangaroon or its other projects. If it does, this could materially reduce Dreadnought's proportionate ownership of the relevant project(s).

Given the uncertainties involved, investors should not make any investment decisions based solely on the results of the Study.

This announcement has been prepared in compliance with the JORC Code 2012 Edition ("**JORC**") and the ASX Listing Rules. All material assumptions, on which the forecast financial information is based, have been included in this announcement and are also outlined in the attached JORC Table disclosures.

Overview

Main activities include the following outsourced activities:

- installation of a mobile mining camp proximal to the Star of Mangaroon;
- initial contract development of an open pit (12 months);
- contract haulage for 330kms; and
- processing at Black Cat's Paulsens processing facility.

Physical & Financial Summary

The Study demonstrates a robust economic case, mining an initial ~20koz, which generates an Operating Cashflow of ~40.1M (@ 4,100/oz) over one year at an AISC of 1,800/oz.

Current market conditions have been factored into the Study costs and show that Star of Mangaroon is expected to be highly competitive alongside other active WA gold operations.

A gold price of 4,100/0 has been used in the Study. The gold sector is strong with the average spot price since October 2024 consistently above 4,100/0. Indicative forward market prices available are at 4,6000.

¹ Average gold forward sales price based on a \$4,390/oz spot price and assumes commencing delivery date of January 2026 for 12 months. The forward prices have been provided by an independent source (a large Australian bank) with inputs used being the prevailing data as of 23 January 2025. The quoted price of \$4,600/oz has been rounded down to the nearest \$10.

Table 1: Star of Mangaroon Physicals Summary

Project Physicals	Units	Total
Duration	Months	12
Mined Ore	kt	62.1
Grade	g/t Au	10.0
Gold in Ore	koz	19.9
Recovery	%	98
Gold Recovered	koz	19.5

Table 2: Star of Mangaroon Financial Summary

Project Financials	Units	Total
Gold Price	\$/oz	4,100
Revenue	\$M	80.1
Capital Costs		
Pre-Production Infrastructure	\$M	1.7
Pre-Production Development	\$M	1.2
Rehabilitation	\$M	1.8
Operating Costs		
Mining	\$M	25.5
Ore Haulage and Processing	\$M	6.7
Royalties	\$M	3.0
Operating Cashflow (after all Capital and Tax)	\$M	40.1
AISC	\$/oz	1,800

Investors are advised the Study is a preliminary economic assessment based on assumptions outlined in this document and a range of financial outcomes are possible: +/-10% variance from the base case is shown below.

Figure 1: Sensitivity of project variables.

A gold price movement of \$100/oz changes Operating Cashflow by ~\$1.9M as shown in the price range below:

Table 3: Sensitiv	ity to \$100/oz	z gold price increments
-------------------	-----------------	-------------------------

Gold Price \$/oz	Operating Cashflow (\$M)
\$3,600	\$30.7
\$3,700	\$32.6
\$3,800	\$34.5
\$3,900	\$36.4
\$4,000	\$38.2
\$4,100 (base case)	\$40.I
\$4,200	\$42.0
\$4,300	\$43.9
\$4.400 (~spot)	\$45.8
\$4,500	\$47.6
\$4,600 (~forward)	\$49.5

Opportunities

There are extensive opportunities to build on the Study including:

- Potentially proving up additional Resources on <u>existing mining leases</u>, these include Popeye, Star of Mangaroon extensions, Two Peaks, Lead Gold Mine and Pritchard's.
- Potential for gold recovery from an existing heap leach located on the Star of Mangaroon mining lease and within the limits of the pit design.
- Spare capacity within the mining fleet may be utilised for additional mining within the operational period.
- Use of forwards increases the Study Operating Cashflow to ~\$50M.

Existing Mining Leases

There are currently 5 granted mining leases within the area covering historical mines and include the Star of Mangaroon, Lead Gold Mine, Two Peaks and Pritchard's. Proving up additional Resources on the existing mining leases could extend production with minimal additional approvals.

In addition, there is potential to extend the Star of Mangaroon along strike and at depth. Immediate follow up targets from initial drilling include Popeye which intersected 3m @ 22.8 g/t Au from I3m (POPRC001).

Drilling on the existing mining leases will be priority work commencing in early 2025.

Figure 2: Long Section from Popeye through the Star of Mangaroon showing the location of historic and recent drilling highlighting the lack of drilling along strike and at depth at the Star of Mangaroon.

Heap leach

There is a historic heap leach (\sim 30m x 35m x 2m) located within the open pit. Grab samples of 10g/t Au have been recorded from the heap leach. Systematic full-depth sampling of the heap leach may result in additional economic material.

Figure 3: Location of heap leach within the pit design.

Camp Scale Prospects

Dreadnought has identified three camp scale prospects with the potential to deliver additional discoveries. These include Bordah, High Range and additional targets around the Star of Mangaroon. Any significant discovery could provide material to extend operations.

Target generation and definition work is ongoing to deliver targets for drilling in the second half of 2025.

Figure 4: Plan view image of a portion of Mangaroon highlighting the main gold and base metal camp scale prospects which are the focus of ongoing target generation and definition work.

Excavator Utilisation

The mining schedule is driven by excavator hours, which are capped at a conservative 350 hours in the first month of mining, and 450 hours per month thereafter. The mining schedule is also constrained by applying a maximum vertical rate of descent of 15m, equivalent to 3x5m benches.

A total of 3,069 excavator hours are utilised in the mining schedule.

A total of 891 available excavator hours are available but not utilised during the final 5 months of mining.

Additional mining opportunities at Mangaroon could utilise these available hours and potentially further improve cost metrics.

Figure 5: Star of Mangaroon fixed costs and excavator utilisation

• Use of forwards increases the Study Operating Cashflow to ~\$50M.

Figure 6: Photo of the historical infrastructure at the Star of Mangaroon.

JORC Code 2012 and ASX Listing Rules

This announcement has been prepared in accordance with JORC and ASX Listing Rules. Investors are referred to several important statements in relation to this announcement and the Study contained herein including the Cautionary Statement; Forward Looking Statements; Sensitivity Analysis; and Competent Persons' Statements.

Cautionary Statement (In Accordance with Clause 38 of JORC)

Margin for Error: The Study documented in this announcement has a +/-30% Scoping Study level of accuracy.

Assumptions: The Study is based on the material assumptions outlined in this announcement. While Dreadnought considers all the material assumptions to be based on reasonable grounds, there is no certainty that they will prove to be correct or that the range of outcomes indicated by the Study will be achieved.

Inferred Resources: The Study includes a production target comprising Indicated (87%) and Inferred Resources (13%). Investors are cautioned that there is a low level of geological confidence in Inferred Resources and there is no certainty that further drilling will result in the determination of Measured or Indicated Resources or that a production target will be realised.

Further Work Required: The Study has been undertaken to determine the potential viability of open pit mining at Star of Mangaroon. Scoping studies are preliminary technical and economic assessments of the potential viability of mining and are based on low level technical assessments that are not yet sufficient to support the estimation of Ore Reserves. Further exploration and evaluation work and appropriate studies may be required before the estimation of Ore Reserves or to provide any assurance of an economic development case.

Value Realisation: Dreadnought could pursue other 'value realisation' strategies such as a sale, partial sale or joint venture of Star of Mangaroon. If it does, this could materially reduce Dreadnought's proportionate ownership of the relevant project(s).

Uncertainty: Given the uncertainties involved, investors should not make any investment decision based solely on the results of the Study.

Economic Viability: Dreadnought considers the deposits subject to the Study to be economically viable based on a gold price of \$4,100/oz.

Funding: To achieve the range of outcomes indicated in the Study, funding of ~\$10.2M (maximum cash drawdown) will be required to commence initial production. This funding is assumed. Investors should note that there is no certainty that Dreadnought will be able to generate or raise that amount of funding when needed. It is also possible that such funding may only be available on terms that may be dilutive to or otherwise affect the value of Dreadnought's existing shares.

The Company believes that it is reasonable to assume there will be available funding to commence Star of Mangaroon because:

- These are strong technical and economic fundamentals which provide an attractive return on capital investment and generate a robust cashflow at a range of gold prices below current market levels. This provides a strong platform to attract both debt and equity investment.
- The board and management of have a strong track record of raising equity funding as required to further exploration and evaluation of the Mangaroon Gold Project
- The board and management have strong experience in project funding mine development with a mixture of debt and equity.
- The project is in a stable geopolitical environment with established infrastructure and regulations. Details of the Study follow.

STAR OF MANGAROON SCOPING STUDY January 2025

For personal use only

I. INTRODUCTION

Dreadnought owns 100% of ~5,300km² of highly prospective ground at Mangaroon located ~250km south-east of Exmouth in the Gascoyne Region of WA and is accessed by the Towera, Lyndon and Ullawarra Roads.

<u>Part of the area is comprised of the ~10km x 15km Mangaroon Gold Camp (Au, Cu-Zn-Ag-Au)</u>: where fractured, small-scale ownership has limited previous gold exploration with only ~200m of the >12km long Mangaroon Shear Zone having been drilled. This area is a focus for Dreadnought.

The Star of Mangaroon, located within the <u>Mangaroon Gold Camp</u>, was mined between 1960 and 1983 and produced a total of 7,464 oz @ 34.8 g/t Au.

Dreadnought's objective is to commence open pit mining at Star of Mangaroon in 2025 and process material at Black Cat's Paulsens processing facility. Ongoing exploration is expected to prove up further gold in the region for future mining.

Figure 1: Star of Mangaroon location relative to Paulsens processing facility.

2. STUDY PARAMETERS

The Study is based on the following outsourced activities:

- Constructing a mobile camp proximal to the mine;
- · Clearing vegetation and removal of topsoil prior to mining;
- Contractor open pit mining for 12 months;
- Contract haulage; and
- · Processing at Black Cat's Paulsen processing facility; and
- Contractor demobilisation at the completion of mining.

3. STUDY TEAM

The following consultants contributed to the Study.

Table 1: Consultant contributions to the Study

Study Area	Consultant	Scope
Fauna & Flora	Onshore Environmental	 Desktop flora, vegetation & fauna assessment (2021) Reconnaissance flora and vertebrate fauna survey (2021) Targeted flora survey & vegetation type mapping (2022, 2023) Fauna survey (2023)
Geotechnical	Peter O'Bryan & Associates	Pit wall stability assessment (2024)
Metallurgy	Strategic Metallurgy	 Gravity and cyanide leachable recovery of 5x diamond core composite samples (2024)
Mineral Resource	Payne Geological Services	 Validation of exploration drilling data Interpretation and modelling of all geological domains and structures Generation of a Resource model (2024)
Mining and Processing	Black Cat	 Early contractor engagement Open pit optimisation, mine design and scheduling Capital cost estimation Financial modelling

4. PERMITS & APPROVALS

Star of Mangaroon has low approval barriers being located on approved and developed mining lease (M09/175) and is accessible via miscellaneous lease L09/114.

Baseline environmental studies required to support a Mining Proposal submission are underway and are expected to be completed in early 2025 as detailed below.

Table 2: Studies pending

Waste Rock Characterisation	Botanica Consulting	Acid mine drainage & rehabilitation

5. GEOLOGY & MINERALISATION

The Star of Mangaroon lies within the Proterozoic Gascoyne Province, in a zone of highly strained NW trending paragneiss and paraschistose metamorphic rocks whose protolith were either sedimentary or felsic volcanic rocks. The gneiss outcropping at Star of Mangaroon is a laminated sugary quartz micaceous (biotite) rock which has undergone upper amphibolite to granulite facies regional metamorphism.

The principal gold-bearing horizon consists of an anastomosing quartz vein with a strike of $\sim 10^{\circ}$ dipping to the east at $\sim 65^{\circ}$. The gold-bearing vein system is about 150m long and 2-4m wide, hosted in a NS trending foliation. The mineralisation in the northern portion appears to change to a more stockwork type of disseminated gold, and changes to a more NW trending direction as it becomes sub-parallel to the WNW-ESE trending regional structural. Based on analysis of hand specimens and historical mineralogy reports, the mineralisation at Star of Mangaroon is hosted in crystallised quartz vein, consisting of a quartz-muscovite-pyrrhotite-chalcopyrite-arsenopyrite gold assemblage. Geochemical pathfinders for the gold mineralisation observable in orientation soil surveys and whole rock geochemistry include Te, Sb, Bi, & As, as well as elevated Ag, Cu, and Pb.

5.1 Resource Model

The November 2024 Resource model was used for the Study. The Resource is 84% Indicated.

	Indicated			Inferred			Total		
Туре	Tonnes	Δ ιι (σ/t)	Au	Tonnes	Δ ιι (σ/t)	Au	Tonnes	Δ ιι (σ/t)	Au
	Tonnes	Au (8/0)	(Oz)	Tonnes	Au (8/0)	(Oz)	Tonnes	Au (8/0)	(Oz)

Total	44,500	13.6	19,500	12,200	9.8	3,900	56,700	12.8	23,300

Table 3: Star of Mangaroon November 2024 Resource

6. GEOTECHNICAL PARAMETERS

Recommendations for wall design were based on information from geotechnical logging of two geotechnical diamond drill holes (SOMDD007, SOMDD009) and an additional six diamond drill holes (SOMDD001 – SOMDD006) from within the open pit. The base case wall design parameters are as follows:

Parameter	North & West Walls	South & East Walls	Upper Limit (mRL)	Lower Limit (mRL)
Face Height (m)	10	10	Surface	275
Face Height (m)	20	20	275	235
Face Height (m)	30	30	275	Base of pit
Face Angle (°)	55	50	Surface	275
Face Angle (°)	60	55	275	255
Face Angle (°)	75	60	255	235
Face Angle (°)	75	75	235	Base of pit
Berm Width (m)	5	5	275	275
Berm Width (m)	7	7	255	Base of pit

Table 4: Open pit wall design parameters

7. HYDROLOGY AND HYDROGEOLOGY

The region comprises low undulating hilly country with stony and hardpan wash plains. Minor local drainage channels intersect the area which are subject to seasonal flow. Natural groundwater level in the region is 20-30m below surface. Groundwater is fresh to brackish, ranging from 1,000-5,000ppm TDS.

Groundwater inflow rates below the water table are expected to be minimal (<2.5L/sec). This is interpreted from water return from drilling and an assessment of data from existing bores within a 5km radius of Star of Mangaroon.

To manage flooding, all landforms and work areas have been designed away from watercourses.

8. METALLURGICAL TEST WORK

Metallurgical test work comprised conventional gravity and carbon-in-leach gold recovery at a range of grind sizes and used site water from Black Cat Paulsens Gold Operation in four of the five tests².

Composite samples from the 2023 Star of Mangaroon RC drilling program (SOMRC004-SOMRC008) were selected to represent a range of head grades and locations within the mineralised lode and inside the open pit.

Gravity tests were carried out to simulate a gravity recovery stage as part of a conventional milling circuit. To approximate this, the sample was stage ground to 212µm using a laboratory rod mill and the product was upgraded using a Falcon Concentrator. The concentrate was then leached and the solution analysed for gold content. The gravity tailings were then homogenised with the bulk sample before cyanidation test work.

Cyanide leach tests were carried out at P80 grind sizes of 212µm, 150µm, 106µm, 75µm. Milled samples were transferred to a bottle where cyanide and lime were added to achieve the required pH of 10.

The combined gravity and leach extractions and associated reagent consumptions are shown in Table 5.

Comp.	Grind	Head	Gravity Gold	Gold Extraction (%)			Gold Extraction (%) Tai	Tails	Rea Consu	gent mption

Average		11.01	74.4	93.6	95.2	96.4	96.7		0.39	1.28

Table 5: Gravity and leach test results for composites S1 – S5

Gravity recoveries range from 55-85% with an average gravity recovery of 74% using a coarse grind size of 212µm. The highest recoveries were recorded in composites S2 and S4, however all results are well above industry averages and reflect the high-grade (coarse gold) nature of these samples.

A metallurgical recovery of 98% was selected for the Study. This is based on the average metallurgical recovery of the 75-106µm test work with estimated processing gold solution and carbon attrition losses.

Table 6: Summary table of metallurgical recovery and reagent usage

Composite ID	I 06µm 24hr Recovery	75µm 24hr Recovery

² ASX announcement 14 October 2024: Exceptional Recoveries from Star of Mangaroon – Mangaroon Au (100%)

9. OPEN PIT DESIGN – MODIFYING PARAMETERS

The open pit process included the following steps:

9.1 Resource Dilution

Datamine's Mineable Shape Optimiser ("**MSO**") software was used to apply mining dilution to the November 2024 Resource model and to define economic material above the cut-off grade. Parameters used in MSO are summarised below:

Table 7: Resource model dilution settings for MSO

Parameter	Units	Setting
Cut-off Grade	g/t Au	1.0
Minimum Ore Width (excl. dilution)	М	1.0
Dilution Skin Width	М	Footwall = 0.5
		Hangingwall = 0.5
Minimum Waste Pillar	М	2.0
Other Block Dimensions	М	Y = 5.0
		Z = 2.5

9.2 Open Pit Optimisation

Open pit optimisation shells were generated in Datamine's NPV scheduler software using the MSO diluted Resource model, contractor supplied rates, overall wall angles based on geotechnical parameters and metallurgical recovery.

uble 0. Open pit opunisation parame		
Parameter	Units	Unit Rate
Gold Price	\$/oz	\$4,000
Royalties (State and other)	% Revenue	4%

Mining Recovery	%	95% ³
Metallurgical Recovery	%	98%
Slope Angles	0	Transitional = 40°
		$Fresh = 45^{\circ}$

 Table 8: Open pit optimisation parameters

9.3 Open Pit Mine Design

The 100% revenue factor optimisation shell was used to design the open pit.

Open pit design parameters included:

- 12m wide, 1:9 gradient single lane ramp for the entirety of the open pit:
- 20m vertical interval between dual lane passing bays;
- Open pit walls and berms were designed according to the specified geotechnical parameters detailed in Table 4.

The pit design is 250m long, 180m wide and 85m deep and is shown in Figures 2-4.

³ 95% mining recovery was applied to the optimization process. The open pit physicals apply 100% mining recovery, with an additional 200% dilution applied to the 5% Ore excluded from the optimization process.

Figure 2: Plan view of the Star of Mangaroon pit design and Resource

Figure 3: Long section (looking west) of the Star of Mangaroon pit design and Resource

Figure 4: Oblique view of the Star of Mangaroon pit design and Resource

Other infrastructure designed on tenement M09/175 include: a waste dump, ore pad ("**ROM**"), water storage dam, topsoil storage stockpiles, roads, etc. Quantities for clearing, stripping, and stockpiling of vegetation and topsoil were calculated using the design footprint.

Figure 5: Star of Mangaroon open pit mine infrastructure on mining lease M09/175.

Other mine design and scheduling assumptions include the following:

- Required RC grade control drill metres for the life of mine were estimated to be 1,500m.
- Blast hole drill metres and explosive quantities were calculated using the parameters detailed in Table 9. 100% blasting was assumed.
- Load and haul production was scheduled based on the capability of a 100t class excavator and 100t rigid trucks, mining 2.5m flitch heights, with consideration of haulage distance to stockpile locations.

Table 9: Open pit drill and blast parameters

Production Drilling Parameters				
Material Type	Transitional	Fresh		
Hole Diameter (mm)	102	102		
Burden (m)	3.0	2.7		
Spacing (m)	3.4	3.1		
Sub-drill (m)	0.5	0.7		
Wall Control Factor (batter holes/pre-splits)	1.05	1.17		
Powder Factor (kg/bcm)	0.5	0.7		
Ave Penetration Rate (m/hr)	30	22		

9.4 Mining Recovery

The Study assumes 100% of the diluted MSO Resouce is recovered as Ore, with the following assumptions:

- 95% of the Ore mined as per the diluted MSO Resource model with no further modifying factors applied; and
- 5% of the Ore applies a nominal 200% additional dilution at 0.00g/t Au.

The open pit physicals are shown below.

Table 10: Open pit physicals

Ore Physicals	Units	Total
High Grade Ore Tonnes (95% Ore)	kt	53.6
High Grade Ore Grade (95% Ore)	g/t Au	11.0
High Grade Gold in Ore (95% Ore)	koz	18.9
Low Grade Ore Tonnes (5% Ore)	kt	8.5
Low Grade Ore Grade (5% Ore)	g/t Au	3.7
Low Grade Gold in Ore (5% Ore)	koz	1.0
Total Ore Tonnes	kt	62.1
Total Ore Grade	g/t Au	10.0
Total Gold in Ore	koz	19.9

9.5 Open Pit Physicals

Table 3: Open pit physicals

Open Pit Physicals	Units	Total
Total Volume	kBCM	1,176
Duration	Months	12
Dig Rate	BCM/hr	380
Total Ore Tonnes	kt	62.1
Ore Grade	g/t Au	9.98
Total Gold in Ore	koz	19.9
Ore Recovery	%	98
Gold Recovered	koz	19.5

10. OTHER MINE INFRASTRUCTURE

Infrastructure to support mining the Star of Mangaroon has been designed within 10km of the open pit. Provisional locations for the accommodation village, mine office/ workshop, and explosives magazine are subject to change pending the outcome of planned resource drilling scheduled to commence in early 2025.

Figure 6: Star of Mangaroon provisional site layout for supporting infrastructure

10.1 Accommodation

The mobile accommodation village will be constructed within 10km of the mine. The Study has assumed M09/146 and M09/147 will be used for this purpose.

A reputable supplier has provided a quote to construct a turnkey mobile accommodation solution for up to 52 people. Peak workforce is estimated to be \sim 40 people on site.

10.2 Mine Offices/ Workshop

M09/175 has an area of ~40Ha. A 500m blast exclusion zone extends beyond the limits of M09/175 meaning all facilities must therefore be located elsewhere. M09/91 is located 1.5km from the mine and is suitable for this purpose.

10.3 Explosives Magazine

M09/174 is located \sim 2km from the proposed camp location and \sim 8km from the mine and is a suitable location for explosives storage.

10.4 Power Supply

Power will be supplied by transportable diesel fired generator sets, to be installed as required.

Mining contractor rates include all generators and lighting plants required for operations.

Additional cost allowances have been made for power generation at the camp.

10.5 Diesel Supply

An estimated 2ML of diesel are required over the initial production period. Diesel usage was calculated as follows:

- Fuel burn rates from similar operations applied to planned haulage distances for open pit equipment (verified by the mining contractor); and
- Estimates for surface equipment (e.g. loaders, road trains, light vehicles, transportable generators).

10.6 Water Supply

An estimated sustained flow rate of 5L/sec is required to sustain operations and, while the subject of current investigations, is not considered a limiting factor in the Study.

10.7 Airstrips & Flights

Commercial flights to Carnarvon or Exmouth are also available to transport FIFO personnel. Multiple well-maintained private gravel airstrips are located within 50km of the area that may be used for charter flights in and out of Perth for the entire workforce. The suitability and approval to use these strips will be investigated.

10.8 Communications

All broadband internet requirements at the camp and mine will be provided by Starlink Business with each unit providing connectivity for up to 20 users.

II. PROCESSING FACILITY

Dreadnought has an existing non-binding agreement to utilise ~81ktpa spare processing capacity at Black Cat's 450ktpa Paulsens processing facility, located ~330km from Star of Mangaroon.

II.I Processing Method

The processing route at the Paulsens processing facility is summarised below:

- Two stage crushing;
- Grinding in a ball mill to 75-106 micron;
- Gravity concentration, followed by batch intensive leaching of the gravity concentrate;
- · Leaching and adsorption in a carbon in leach circuit; and
- Transfer of tailings to a storage facility.

II.2 Processing Schedule

A one-month lag has been applied between mining and hauling/processing Ore from Star of Mangaroon to the Paulsens processing facility.

Figure 7: Ore haulage and processing schedule

12. ENVIRONMENT & SOCIAL

Since 2021, Dreadnought has undertaken numerous environmental studies across the area and is currently undertaking multistage detailed flora and fauna surveys over the Star of Mangaroon and planned areas of infrastructure. No declared rare species or threatened ecological communities have been identified.

Dreadnought will work to mitigate environmental impacts as a result of any future mining or mineral processing.

Star of Mangaroon is on Thudgari Native Title Determined lands. Agreements for both mining and exploration are in place. Multiple archaeological and ethnographic surveys have been conducted with the Thudgari People with no significant sites identified related to exploration or mining activities associated with the Star of Mangaroon.

Dreadnought has and will continue to communicate and liaise with various other stakeholders including, traditional owners and regulatory bodies, and pastoralists.

13. FINANCIAL EVALUATION

13.1 Capital Costs

Table 12: Capital costs

Item	Units	Total
Infrastructure Capital	\$M	1.7
Development Capital	\$M	1.2
Total Pre-production Capital	\$ M	2.9
Rehabilitation	\$M	1.8
Total Capital	\$ M	4.8

13.2 Operating Costs

Salaries were adjusted in line with prevailing industry rates. An allowance of 30% on-costs has been added to base salary levels to cover annual leave, sick leave, public holidays, long service leave, superannuation, worker's compensation insurance and payroll tax.

Flight and accommodation costs are based on pricing received from service providers.

Surface haulage costs were estimated based on a unit rate of ~\$0.12 per tonne kilometre (wet).

Open pit mining uses contractor supplied rates for the provision of machinery and personnel. Productivity rates were calculated from first principles.

Table 13: Open pit and processing unit costs

Activity	Units	Unit Cost Trans	Unit Cost Fresh
Drilling	\$/bcm	\$0.84	\$2.41
Blasting	\$/bcm	\$1.86	\$3.17
Load & Haul Ore	\$/bcm	\$7.51	\$11.28
Load & Haul Waste	\$/bcm	\$7.86	\$9.68
Ancillary Works	\$/bcm	\$1.12	\$1.12
Grade Control	\$/tonne	\$1.60	\$1.60
Mining Overheads	\$/bcm	\$8.86	\$8.86
Surface Ore Haulage	\$/tonne	\$44.08	\$44.08
Processing	\$/tonne	\$55.00	\$55.00

Other economic inputs for the Study are detailed below.

Table 14: Other Economic Inputs

Other Economic Inputs	Units
Gold Price	\$4,100/oz
Diesel Price (excl. Fuel Tax Credit)	\$1.56/L
WA State Government Royalty (initial ~2,500 ounces produced are royalty free)	2.5%
Other Royalties	1.5%

13.3 Project Overview and Sensitivities

The physicals and financials of the Study are detailed below.

Table 15: Key physical outputs of the Study

Project Physicals	Units	Total
Initial Duration	Months	12
Ore Mined	kt	62.1
Ore Grade	g/t Au	9.98
Gold in Ore	koz	19.9
Recovery	%	98
Gold Recovered	koz	19.5

Table 16: Key financial outputs of the Study

Project Financials	Units	Total
Gold Price	\$/oz	4,100
Gold Revenue	\$M	80.1
Capital Costs		
Pre-Production Infrastructure	\$M	1.7
Pre-Production Development	\$M	1.2
Rehabilitation and Demobilisation	\$M	1.8
Operating Costs		
Mining	\$M	25.5
Ore Haulage and Processing	\$M	6.7
Royalties	\$M	3.0
Operating Cashflow (after all capital and tax)	\$M	40.1
AISC	\$/oz	1,800

A gold price movement of \$100/oz changes Operating Cashflow by ~\$1.9M as shown in the price range below: Table 17: Sensitivity to \$100/oz gold price increments

Gold Price \$/oz	Operating Cashflow (\$'M)
\$3,600	\$30.7
\$3,700	\$32.6
\$3,800	\$34.5
\$3,900	\$36.4
\$4,000	\$38.2
\$4,100 (base case)	\$40.1
\$4,200	\$42.0
\$4,300	\$43.9
\$4,400 (~spot)	\$45.8
\$4,500	\$47.6
\$4,600 (~forward)	\$49.5

14. OPPORTUNITIES

There is extensive opportunity to build on the Study:

14.1 Existing Mining Leases

There are currently 5 granted mining leases within the Mangaroon Project covering historical mines that were worked by prospectors and pastoralists. These mining leases have seen minimal systematic exploration. These mining leases include the Star of Mangaroon, Lead Gold Mine, Two Peaks and Pritchard's (2 tenements).

Proving up additional Resources on the existing mining leases could extend production with minimal additional approvals.

Within the Star of Mangaroon mining lease, there is potential to extend mineralisation along strike and at depth as well as an immediate follow up target from initial drilling at Popeye which intersected 3m @ 22.8 g/t Au from I3m (POPRC001).

Drilling on the existing mining leases will be priority work commencing in early 2025.

Figure 9: Long Section from Popeye through the Star of Mangaroon showing the location of historic and recent drilling highlighting the lack of drilling along strike and at depth within the Star of Mangaroon mining lease.

14.2 Heap leach

There is a $30m \times 35m \times 2m$ historic heap leach facility located within the pit crest. Grab sample assays of 10g/t have been recorded from the heap leach facility. Systematic full-depth sampling of this facility may result in additional economic material.

Figure 10: Location of heap leach within the pit design.

14.3 Camp Scale Prospects

Dreadnought has identified three camp scale prospects with the potential to deliver additional discoveries. These include Bordah, High Range and additional targets around the Star of Mangaroon. Any significant discovery could provide medium to longer term material to extend operations.

Target generation and definition work is ongoing with an aim to deliver targets for drilling in the second half of 2025.

Figure 11: Plan view image of a portion of Mangaroon highlighting the main gold and base metal camp scale prospects which are the focus of ongoing target generation and definition work.

14.4 Excavator Utilisation

The mining schedule is driven by excavator hours, which are capped at a conservative 350 hours in the first month of mining, and 450 hours per month thereafter. The mining schedule is also constrained by applying a maximum vertical rate of descent of 15m, equivalent to 3x5m benches.

A total of 3,069 excavator hours are utilised in the mining schedule.

A total of 891 available excavator hours are available but not utilised during the final 5 months of mining.

Additional mining opportunities at Mangaroon could utilise these available hours and potentially further improve cost metrics.

Figure 12: Star of Mangaroon fixed costs and excavator utilisation

I5. NEXT STEPS

Following the success of the Study, Dreadnought will continue to progress approvals.

- Early 2025: Complete studies (fauna, hydrology, hydrogeology, soil & waste rock characterisation).
- Early 2025: Identify groundwater source for dust suppression.
- Mid 2025: Finalise any additional tenement requirements for infrastructure that may be outside approved mining leases.
- Mid 2025: Apply for regulatory approvals to operate and finalise mining and processing agreements.
- Late 2025: Approval to operate granted.

Figure 13: Photo of the historical infrastructure at the Star of Mangaroon.

16. COMPETENT PERSONS' STATEMENTS

The information in this announcement that relates to the Star of Mangaroon Mineral Resource is based on information compiled by Mr. Paul Payne, a Competent Person who is a Fellow of the Australasian Institute of Mining and Metallurgy. Mr. Payne is a full-time employee of Payne Geological Services Pty Ltd and is a shareholder of Dreadnought Resources Limited. Mr. Payne has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves'. Mr. Payne consents to the inclusion in the announcement of the matters based on his information in the form and context that the information appears.

The information in this report that relates to Open Pit Mining is based on and fairly represents information compiled or reviewed by Mr Alistair Thornton. Mr Thornton is a full-time employee of Black Cat Syndicate Pty Ltd. Mr Thornton has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Thornton is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Thornton is a Member of the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to metallurgy and the processing response is based on and fairly represents information compiled or reviewed by Mr Nick Vines. Mr Vines is a full-time employee of Strategic Metallurgy Pty Ltd. Mr Vines has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Vines is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the processing method and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Vines is a Member of the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information in the original reports, and that the form and context in which the Competent Person's findings are presented have not been materially modified from the original reports.

Forward Looking Statements

This announcement may refer to the intention of Dreadnought regarding estimates or future events which could be considered forward looking statements. Forward looking statements are typically preceded by words such as "Forecast", "Planned", "Expected", "Intends", "Potential", "Conceptual", "Believes", "Anticipates", "Predicts", "Estimates" or similar expressions. Forward looking statements, opinions and estimates included in this announcement are based on assumptions and contingencies which are subject to change without notice and may be influenced by such factors as funding availability, market-related forces (commodity prices, exchange rates, stock market indices and the like) and political or economic events (including government or commodity issues, global or systemic events). Forward looking statements are provided as a general reflection of the intention of the Company as at the date of release of this announcement, however, are subject to change without notice, and at any time.

Future events are subject to risks and uncertainties, and as a result, performance and achievements may in fact differ from those referred to in this announcement. Mining, by its nature, and related activities including mineral exploration, are subject to multiple variables and risks, many of which cannot be adequately addressed, or be expected to be assessed in this announcement. Work contained within or referenced in this announcement may contain incorrect statements, errors, miscalculations, omissions, and other mistakes. For this reason, any conclusions, inferences, judgements, opinions, recommendations, or other interpretations either contained in this announcement, or referencing this announcement, cannot be relied upon. There can be no assurance that future results or events will be consistent with any such opinions, forecasts, or estimates. The Company believes it has a reasonable basis for making the forward-looking statements contained in this announcement, with respect to any Production Targets, Resource statements or financial estimates. However, further work to define Resources or Ore Reserves, technical studies including feasibilities and related investigations are required prior to commencement of mining. No liability is accepted for any loss, cost or damage suffered or incurred by the reliance on the sufficiency or completeness of the information, opinions or beliefs contained in this announcement.

The Studies referred to in this announcement are based on technical and economic assessments to support the estimation of Production Targets. There is no assurance that the intended development referred to will proceed as described and will rely on access to future funding to implement. Dreadnought believes it has reasonable grounds to support the results of the Studies. At the date of this announcement, there is no guarantee that funding will be available to the Company and should not be solely relied upon by investors when making investment decisions. Dreadnought cautions that mining and exploration are high risk and subject to change based on new information or interpretation, commodity prices or foreign exchange rates. Actual results may differ materially from the results or Production Targets contained in this announcement. Further evaluation is required prior to a decision to mine is made. The estimated Resources quoted in this announcement have been prepared by Competent Persons as required under the JORC Code (2012). Material assumptions and other important information are contained in this announcement.

Snapshot – Mangaroon Gold (100%)

Mangaroon Gold is 100% Owned by Dreadnought

 Mangaroon covers >5,300kms² with an initial focus on the ~15km x 10km gold system situated over the Mangaroon Shear Zone between the crustal scale Minga Bar and Edmund Faults with multiple phases of intrusions. Numerous historical workings along the Mangaroon Shear Zone have only seen limited, shallow drilling along ~200m of strike near the Star of Mangaroon mine.

Self-Funded Explorer Strategy

 Dreadnought's strategy is to transform into a self-funded explorer. This involves a potential high-grade open pit at the Star of Mangaroon where funding, development, haulage & processing are outsourced to third parties. This is a common model in WA given the robust gold price. Once successful, extend this model to Popeye, Two Peaks, Lead, Pritchard Well, etc. In this way, there is reduced reliance on market funding and internal cashflows are aimed at making life-changing discoveries.

Consolidation Provides for First Ever Modern Exploration

• All historical workings and known gold occurrences relate to outcropping mineralisation. There has been minimal historical and modern exploration due to fractured, small-scale ownership with Dreadnought now undertaking modern exploration for the first time.

Significant, Step-change, Growth Potential

- Five historical mines developed on outcropping mineralisation and dozens of gold occurrences along highly prospective structural corridors.
- Dreadnought is deploying modern geochemical and geophysical techniques to explore for mineralisation under shallow cover. These techniques have already generated new prospects with stronger and larger signatures than the historical mines, including the region's largest high-grade producer at the Star of Mangaroon mine.
- Project-wide stream sediment sampling and geophysical surveys have identified additional camp scale prospects at Bordah and High Range.

Shallow, High-grade Gold

The Resource contains **shallow**, **high-grade gold** as defined in Table I below:

 Table 18: Resource (2g/t Au cut-off grade) - Numbers may not add up due to rounding.

Type	Indicated			Inferred			Total		
1700	Tonnes	Au (g/t)	Au (Oz)	Tonnes	Au (g/t)	Au (Oz)	Tonnes	Au (g/t)	Au (Oz)
Transition	1,900	26.9	1,700	-	-	-	1,900	26.9	I,700
Fresh	42,500	13.0	17,800	12,200	9.8	3,900	54,700	12.3	21,700
Total	44,400	13.6	19,500	12,200	9.8	3,900	56,600	12.8	23,400

 Popeye, located <1km from the Star of Mangaroon, contains significant shallow high-grade gold intersections including:

POPRC001: 3m @ 22.8 g/t Au from 13m POPRC002: 1m @ 1.6 g/t Au, 15.5g/t Ag from 11m

Exceptional Metallurgical Recoveries

• The region is known for its free gold. Accordingly, recent metallurgical work at Star of Mangaroon produced exceptional recoveries from standard gravity and carbon in leach circuits averaging 96.7% combined recovery including an average 74.4% gravity recovery (ASX.DRE 14 October 2024).

Background on Mangaroon (E8/3178, E08/3229, E08/3274, , E08/3275, E08/3439, E09/2290, E09/2359, E09/2370, E09/2384, E09/2405, E09/2422, E09/2433, E09/2448, E09/2449, E09/2450, E09/2467, E09/2473, E09/2478, E09/2535, E09/2616, M09/91, M09/146, M09/147, M09/174, M09/175: 100%)

Mangaroon (Figure 14) covers >5,300kms² of the Mangaroon Zone in the Gascoyne Region of Western Australia and is comprised of:

- <u>>45km long Money Intrusion (Ni-Cu-Co-PGE)</u>: containing high tenor magmatic Ni-Cu-Co-PGE.
- <u>~10km x 15km Mangaroon Gold Camp (Au, Cu-Zn-Ag-Au)</u>: where fractured, small-scale ownership has limited previous gold exploration with only ~200m of the >12km long Mangaroon Shear Zone having been drilled.
- <u>~43km long Yin Ironstone (REE)</u>: which already contains: an independent Resource of 20.06Mt @ 1.03% TREO (ASX 5 Jul 2023) over only ~4km of the ~43km of ironstones including an initial Indicated Resource of 5.52Mt @ 1.23% TREO over only ~250m of strike (ASX 5 Jul 2023).
- <u>~17km long Gifford Creek Carbonatites (REE-Nb-Ti-P-Sc)</u>: which contains a suite of critical minerals and an initial independent Inferred Resource of 10.84Mt @ 1.00% TREO at C3 (ASX 28 Aug 2023).

Figure 14: Plan view map of Dreadnought's 100% owned Mangaroon projects: the >45km long Money Intrusion (Ni-Cu-Co-PGE); the ~10km x 15km Mangaroon gold camp (Cu-Zn-Ag-Au); Yin Ironstone Complex (REE) and the Gifford Creek Carbonatites (REE-Nb-Ti-P-Sc) in relation to major structures, geology and roads.

This announcement is authorised for release to the ASX by the Board of Dreadnought.

Cautionary Statement

This announcement and information, opinions or conclusions expressed in the course of this announcement contains forecasts and forward-looking information. Such forecasts, projections and information are not a guarantee of future performance, involve unknown risks and uncertainties. Actual results and developments will almost certainly differ materially from those expressed or implied. There are a number of risks, both specific to Dreadnought, and of a general nature which may affect the future operating and financial performance of Dreadnought, and the value of an investment in Dreadnought including and not limited to title risk, renewal risk, economic conditions, stock market fluctuations, commodity demand and price movements, timing of access to infrastructure, timing of environmental approvals, regulatory risks, operational risks, reliance on key personnel, reserve estimations, native title risks, cultural heritage risks, foreign currency fluctuations, and mining development, construction and commissioning risk.

Competent Person's Statement – Mineral Resources

The information in this announcement that relates to the Star of Mangaroon Mineral Resource is based on information compiled by Mr. Paul Payne, a Competent Person who is a Fellow of the Australasian Institute of Mining and Metallurgy. Mr. Payne is a full-time employee of Payne Geological Services Pty Ltd and is a shareholder of Dreadnought Resources Limited. Mr. Payne has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves'. Mr. Payne consents to the inclusion in the announcement of the matters based on his information in the form and context that the information appears.

Competent Person's Statement – Exploration Results

The information in this announcement that relates to geology, exploration results and planning, and exploration targets was compiled by Mr. Dean Tuck, who is a Member of the AIG, Managing Director, and shareholder of the Company. Mr. Tuck has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Tuck consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

The Company confirms that it is not aware of any further new information or data that materially affects the information included in the original market announcements by Dreadnought Resources Limited referenced in this report and in the case of Mineral Resources, that all material ssumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. To the extent disclosed above, the Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Mangaroon Au, Nb-REE, Ni-Cu-PGE Project (100%)

Mangaroon covers ~5,300kms² and is located 250kms south-east of Exmouth in the Gascoyne Region of WA. At Mangaroon, Dreadnought has consolidated areas of outcropping high-grade gold and historical high grade gold mines including the historic Star of Mangaroon and Diamond gold mines. Exploration at the Money Intrusion has identified high tenor Ni-Cu-PGE sulphides. In addition, Mangaroon has emerged as a globally significant, rapidly growing, potential source of critical minerals. Highlights include:

- An independent Resource for Yin Ironstones Complex of 29.98Mt @ I.04% TREO over only ~4.6kms – including a Measured and Indicated Resource of 26.3Mt @ I.04% TREO (ASX 30 Nov 2023).
- Discovery of the globally significant, Nb-REE-P-Ti-Sc enriched Gifford Creek Carbonatite (ASX 7 Aug 2023).
- A large, independent initial Resource of 10.84Mt @ 1.00% TREO at the Gifford Creek Carbonatites, containing a range of critical minerals including rare earths, niobium, phosphate, titanium and scandium (ASX 28 Aug 2023).

Kimberley Ni-Cu-Au Project (80/100%)

The project is located only 85kms from Derby in the West Kimberley region of WA and was locked up as a Defence Reserve since 1978.

The project has outcropping mineralisation and historical workings which have seen no modern exploration.

Results to date indicate that there may be a related, large scale, Proterozoic Cu-Au VMS system at Tarraji-Yampi, similar to DeGrussa and Monty in the Bryah Basin.

Central Yilgarn Gold, Base Metals, Critical Minerals & Iron Ore Project (100%)

Central Yilgarn is located ~190km northwest of Kalgoorlie in the Yilgarn Craton. The project comprises ~1,400kms² covering ~150km of strike along the majority of the Illaara, Yerilgee, South Elvire and Evanston greenstone belts. Central Yilgarn is prospective for typical Archean mesothermal lode gold deposits, VMS base metals, komatiite-hosted nickel sulphides and critical metals including Lithium-Cesium-Tantalum.

Prior to consolidation by Dreadnought, the Central Yilgarn was predominantly held by iron ore explorers and remains highly prospective for iron ore.

Bresnahan HREE-Au-U Project (100%)

Bresnahan is located ~125km southwest of Newman in the Ashburton Basin. The project comprises ~3,700kms² covering over 200kms strike along the Bresnahan Basin / Wyloo Group unconformity. Bresnahan is prospective for unconformity related heavy rare earth ("**HREE**") deposits similar to Browns Range HREE deposits, unconformity uranium ("**U**") deposits and mesothermal lode gold similar to Paulsens Au-Ag-Sb deposits along strike.

Prior to consolidation by Dreadnought, the Bresnahan Basin had been successfully explored for unconformity uranium with limited exploration for mesothermal gold. Bresnahan is a first mover opportunity to explore for unconformity HREE.

JORC Code, 2012 Edition – Table I Report Template Section I Sampling Techniques and Data (Criteria in this section apply to all succeeding sections.)

Criteria	IORC Code explanation	Commentary
Sampling techniques	 Nature and quality of sampling (e.g. cut channels, random chips or specific specialised industry standard 	Reverse Circulation (RC) and Diamond (DD) drilling was undertaken to produce samples for assaving.
	measurement tools appropriate to the minerals under	BC Drilling
	 investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample 	Two sampling techniques were utilised for the RC drilling, Im metre splits directly from the rig sampling system for each metre and 3m composite sampling from spoil piles. Samples submitted to the laboratory were determined by
	representivity and the appropriate calibration of any	the site geologist.
	measurement tools or systems used.	Im Splits
	 Aspects of the determination of mineralisation that are Material to the Public Report. 	From every metre drilled a 2-3kg sample (split) was sub- sampled into a calico bag via a Metzke cone splitter from each metre of drilling.
	 In cases where industry standard work has been done 	3m Composites
	drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling	All remaining spoil from the sampling system was collected in buckets from the sampling system and neatly deposited in rows adjacent to the rig. An aluminium scoop was used to then sub-sample each spoil pile to create a 2-3kg 3m composite sample in a calico bag
	problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	A pXRF is used on site to help determine mineralised samples. Mineralised intervals have the Im split collected, while unmineralised samples have 3m composites collected.
		Diamond Core
		Core is orientated for structural and geotechnical logging where possible. In orientated core, half core is submitted to the lab for analysis in intervals ranging from 20cm to 1m depending on the geological context. If core is orientated, then the half core is cut so as to preserve the orientation line with the same side of the core submitted down the hole.
		All samples are submitted to ALS Laboratories in Perth for determination of gold by PhotonAssay from crushed sample (ALS Method Au-PA01).
		Select samples are also submitted for 48 multi-elements via 4 acid digestion with MS/ICP finish (ALS Code ME-MS61) to assist with lithological interpretation.
		QAQC samples consisting of duplicates, blanks and CRM's (OREAS Standards) are inserted through the program at a rate of 1:50 samples.
		Historical Drilling
		MA1-28 (Balde Exploration 1988: A24641):
		Every metre a ~2kg sample (split) was subsampled into a plastic bag via a two-tier riffle splitter. A metre was logged geologically and "the most promising drill intersections" were sent to Australian Assay Laboratories in Perth for gold determination by fire assay and a AAS finish.
		(It is worth noting in the geological discussion that "It was virtually impossible to distinguish the orebody from the barren biotite gneiss in rock chips" and the impact that would have on their selective sampling approach).
		MA29-43 Welcome Stranger Mining 1995: WAMEX Report A43137
		Every metre a \sim I-2kg sample (split) was subsampled into a calico bag via a three-tier riffle splitter.
		A four metre composite sample was made from the bulk reject material and sent to Genalysis Laboratories in Perth for determination of gold "at ppm levels" using an aqua regia digest and flame atomic absorption spectrometry (B/AAS) to determine gold values.
		If the 4m composite produced a gold value >0.09 g/t Au, then the 1m splits were collected and sent to Genalysis Laboratories in Perth for determination of gold by fire assay.
		STMRC001 and 005 (Fox Annual Reports and ASX Announcements):
		No details provided asides from discussion of Star of Mangaroone results and collar details of two holes. No further details could be verified, including drill holes undertaken at Prichard Well which produced 3m @ 10g/t Au from a quartz vein.
		SMI-9 (Anthony Stehn)

Criteria	IORC Code explanation	Commentary		
		No detailed information aside from collar and survey details and assay results.		
Drilling techniques	• Drill type (e.g. core, reverse circulation, open-hole	Dreadnought RC Drilling		
5	hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so. by what method etc.).	The first 3 drill holes were completed by Ausdrill utilising a Drill Rigs Australia truck mounted Schramm T685WS drill rig with additional air from an auxiliary compressor and booster. Bit size was $5^3/4^{\circ}$.		
		The remaining drill holes were completed by Topdrill utilising a Schramm T685WS drill rig with additional air from an auxiliary compressor and booster. Bit size was 5½ ".		
		Dreadnought Diamond Drilling		
		The first 2 holes were completed by Hagstrom Drilling with a truck-mounted low impact diamond drill rig. Drilling is either HQ to end of hole or initially HQ and dropping to NQ once the hole is cased off for deeper drill holes.		
		Core was orientated using a Reflex Sprint gyro and True Core Orientation Tool.		
		The remaining diamond holes were completed by Topdrill with a truck-mounted Sandvik DE880 diamond rig. All drilling was HQ3 to improve core recovery and preservation for geotechnical logging.		
		Core was orientated using an Axis Champ Nort <mark>h-</mark> seeking Gyro and True Core Orientation Tool.		
		Historical Drilling		
		All historical drilling reported was completed with Reverse Circulation drilling.		
		Limited information is available and was sourced from:

Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed 	RC Drilling		
	 Measures taken to maximise sample recovery and ensure representative nature of the samples. 	achieve maximum sample recovery and quality through the mineralised zones.		
	• Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Best practice sampling procedure included: suitable usage of dust suppression, suitable shroud, lifting off bottom between each metre, cleaning of sampling equipment, ensuring a dry sample and suitable supervision by the supervising geologist to ensure good sample quality.		
		Diamond Drilling		
		HQ and NQ drilling has been undertaken. All core recoveries are measured and recorded by the drill crew for each run and remeasured and checked by Dreadnought personnel.		
		Core recovery to date has been very high.		
		At this stage, no known bias occurs between sample recovery and grade. Historical Drilling		
Logging	Whether core and chip samples have been geologically	RC Drilling		
	 vvnetner core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean channel atc.) betagraphy. 	RC chips were logged under the supervision of a Senior Geologist with sufficient experience in this geological terrane and relevant styles of mineralisation using an industry standard logging system which could eventually be utilised within a Mineral Resource Estimation.		
	• The total length and percentage of the relevant intersections logged.	Lithology, mineralisation, alteration, veining, weathering and texture were all recorded digitally.		
		Chips were washed each metre and stored in chip trays for preservation and future reference.		
		RC pulp material is also analysed on the rig by pXRF, and magnetic susceptibility meter to assist with logging and the identification of mineralisation.		
		RC logging is qualitative, quantitative or semi-quantitative in nature.		
		Diamond Drilling Diamond core is logged under supervision of a Senior Geologist with sufficient experience in this geological

Quality of assav data	• The nature, auglity and appropriateness of the assaying	Laboratory Analysis
and laboratory tests	and laboratory procedures used and whether the	PhotonAssay is considered a total analysis and Method Au-
	technique is considered partial or total.	PAOI is appropriate for Au determination. ME-MS6I is considered a near total direct and is appropriate for

Critoria	IOPC Code explanation	Commontary
Criteria	instruments, etc., the barameters used in determining the	pathfinder determination
	analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	Standard laboratory QAQC is undertaken and monitored by the laboratory and by the company upon assay result receival.
	 Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	Historical Drilling Limited information is recorded regarding the quality of and appropriateness of the assay data. Those that were reported, were with reputable labs and via fire assay with a AAS finish which is an appropriate technique for the
		determination of gold.
Verification of sampling and assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of brimary data data entry procedures 	Logging and Sampling Logging and sampling were recorded directly into a digital logging system, verified and eventually stored in an offsite database.
	data verification, data storage (physical and electronic) protocols.	Significant intersections are inspected by senior company personnel.
	• Discuss any adjustment to assay data.	3 historical RC holes have been diamond twinned and 4 RC twinned to compare and validate historical RC drilling.
		No adjustments to any assay data have been undertaken.
		14 samples were sent to Intertek for PhotonAssay (PAAU02) for 3 rd party lab verification of ALS assay results. All verified assay results were within an acceptable range.
		Historical Drilling
		No verification of sampling or assaying has been undertaken. Drilling undertaken by Dreadnought in 2023 was done in similar areas to historical drilling and additional drilling will focus in these areas to increase confidence.
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings 	Collar position was recorded using a Emlid Reach RS2 RTK GPS system (+/- 0.2m x/y, +/-0.5m z).
	and other locations used in Mineral Resource estimation.	GDA94 Z50s is the grid format for all xyz data reported.
	• Quality and adequacy of topographic control.	and Hagstrom after the completion of the hole using a Reflex Sprint IQ Gyro. A reading was undertaken every 30 th metre with an accuracy of +/- 1° azimuth and +/-0.3° dip. Azimuth and dip of the drill hole was recorded by Topdrill after the completion of the hole using an Axis Champ North-seeking Gyro. A reading was undertaken every 10 th metre with an accuracy of +/- 0.5° azimuth and +/-0.15° dip. Historical Drilling All drilling reported at the Star of Mangaroon, Two Peaks and Cullen have been verified and resurveyed by Dreadnought. At Cullen and Two Peaks this was done with a handheld GPS Garmin with +/- 3m x/y accuracy) and at the
		Star of Mangaroon using a Emlid Reach RS2 RTK GPS system (+/- 0.2m x/y, +/- 0.5m z); GDA94 Z50 is the grid format for all xyz data reported.
Data spacing and distribution	Data spacing for reporting of Exploration Results.Whether the data spacing and distribution is sufficient to	See table 5 and 6 for hole positions and sampling information.
	 establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	Data spacing at this stage is suitable for Mineral Resource Estimation.
Orientation of data in relation to geological	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which	Drilling was undertaken at a near perpendicular angle to the interpreted strike and dip of the mineralised lode.
structure	 this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	No sample bias is known at this time. Historical Drilling All historical drilling was drilled perpendicular to the targeted structures as understood at the time. The true orientation and relationship with drilling will be determined and confirmed through further drilling.
Sample security	• The measures taken to ensure sample security.	All geochemical samples were collected, bagged, and sealed by Dreadnought staff and were delivered directly to ALS Laboratories Perth by Jarrahbar Contracting or Exmouth Haulage out of Carnarvon or Exmouth. Historical Drilling
		Unknown
Audits or reviews	 The results of any audits or reviews of sampling techniques and data. 	The program is continuously reviewed by senior company personnel.
		SOMDD001-002 have been reviewed and logged by Gerard Tripp of Gerard Tripp PhD Consulting Geologist Pty Ltd. SOMDD003-006 have been reviewed by Paul Payne of PayneGeo Pty Ltd.

Criteria	JORC Code explanation	Commentary
		Historical Drilling
		Collar locations have been visited and confirmed. No other formal audit has been undertaken. Dreadnought drilling has been and will be undertaken over areas historically drilled.

Section 2 Reporting of Exploration Results (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	The Star of Mangaroon Deposit is located within granted Mining M09/175. M09/175 is 100% owned by Dreadnought Resources. M09/175 is subject to a 0.5% Gross Revenue Royalty held by STEHN, Anthony Paterson and BROWN, Michael John Barry. The Star of Mangaroon is covered by the Thudgari (WAD6212/1998) Native Title Determination. The Star of Mangaroon is located within the Maroonah- Mangaroon Pastoral Station.
Exploration done by other parties	 Acknowledgment and appraisal of exploration by other parties. 	Historical exploration of a sufficiently high standard was carried out by a few parties which have been outlined and detailed in this ASX announcement including: Regional Resources 1986-1988s: WAMEX Reports A23715, 23713 Peter Cullen 1986: WAMEX Report A36494 Carpentaria Exploration Company 1980: WAMEX Report A9332 Newmont 1991: WAMEX Report A32886 Hallmark Gold 1996: WAMEX Report A49576 Rodney Drage 2011: WAMEX Report A94155 Sandfire Resources 2005-2012: WAMEX Report 94826
Geology	 Deposit type, geological setting and style of mineralisation. 	The Mangaroon Project is located within Mangaroon Zone of the Gascoyne Province. The Mangaroon Project is prospective for orogenic gold, VMS and intrusion-related base metals, magmatic Ni-Cu- PGE mineralisation and carbonatite hosted REEs and Nb. Gold mineralisation at Star of Mangaroon occurs within a tabular, siliceous horizon at the contact of an paragneiss and underlying orthogneiss.
Drill hole information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	An overview of the drilling program is given within the text and tables within this document.
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	All sample intervals with a minimum length of Im and gold assays greater than 0.3g/t Au have been reported. No top cuts have been applied to exploration results. A top-cut of 70g/t Au has been applied to the Resource. No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect 	Drilling is undertaken close to perpendicular to the dip and strike of the mineralisation.

Criteria	JORC Code explanation	Commentary
	(e.g. 'down hole length, true width not known').	
Diagrams	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	Refer to figures within this report.
Balanced reporting	 Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	The accompanying document is a balanced report with a suitable cautionary note.
Other substantive exploration data	 Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	Suitable commentary of the geology encountered are given within the text of this document.
Further work	 The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	RC drilling Diamond drilling Metallurgical test work Resource estimation Mining studies

Section 3 Estimation and Reporting of Mineral Resources (Criteria listed in the preceding section also apply to this section.)

Cuitauia		Community
Criteria	JORC Code Explanation	Commentary
Database integrity	 Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. 	All drilling data in the Mineral Resource estimate has been generated by Dreadnought in 2023 and 2024. The data has been systematically recorded and stored using industry best practice for data management. Assay data was manually validated against database entries.
Site visits	 Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	A site visit was carried out by the Competent Person on 19 and 20 August 2024. RC drilling was in progress at the time. Drilling and sampling procedures were observed and confirmed to be of best industry practice. General site geology was confirmed including the location of historic workings.
Geological interpretation	 Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. 	The confidence in the underlying geological interpretation is considered to be high and is based on high quality RC and core drilling. Geological logging has been used to assist with identification of lithology, mineralisation and weathering. The deposit consists of a well defined zone of gold mineralisation within a clearly identifiable siliceous horizon. The mineralised zone is variably developed, with the limit of mineralisation based on a gold cut-off grade. Detailed drilling has confirmed geological and grade continuity in the high grade portion of the deposit. A petrographic study conducted by Dr Douglas Mason of Mason Geoscience Pty Ltd during 2024 provided supplementary information that was incorporated into the geological interpretation.
Dimensions	 The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. 	The Star of Mangaroon deposit comprises a single tabular main mineralised zone with a strike length of 110m, is 2m to 10m thick and defined over a dip length of 120m. The deposit has been drilled and interpreted to a maximum vertical interval of 110m from surface.
Estimation and modelling techniques	• The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining,	Using parameters derived from modelled variograms, Ordinary Kriging ("OK") was used to estimate average block grades in two passes using Surpac software.

• • •		
Criteria	 JORC Code Explanation interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. The assumptions made regarding recovery of by-products. Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. Any assumptions about correlation between variables. Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or capping. The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. 	Commentary Linear grade estimation was considered suitable for the deposit due to the generally well defined, disseminated nature of the mineralisation and the absence of erratic high grade outliers in most of the mineralised zones. Maximum extrapolation of wireframes from drilling was 25m down-dip in the poorly tested eastern portion of the deposit. Only gold was estimated. A single block model encompassed the mineralisation. Parent block dimensions used were: 10m y by 2m x by 10m z with sub-cells of 2.5m by 0.5m by 2.5m, The parent block size dimension was selected on the basis of deposit geometry and the drill hole spacing in the well drilled parts of the deposits. For the Mineral Resource area, an orientated 'ellipsoid' search was used to select data and adjusted to account for the variations in zone orientations, however all other parameters were taken from the variography. Multiple passes with expanded search ranges were used for some blocks. A first pass search range of 30m with a minimum of 6 samples and maximum of 12 samples were used. Within the Mineral Resource area, the deposit mineralisation was constrained by wireframes constructed using 0.2g/t Au cut-off grade. The wireframes were applied as hard boundaries. Statistical analysis was carried out on data from the estimation domain. A high grade cut of 70g/t Au was applied to the estimate. Validation of the model included detailed comparison of composite grades and block grades by strike, cross strike and elevation. Validation plots showed reasonable correlation between the composite grades and the block model grades.
Moisture	 Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. 	Tonnages and grades were estimated on a dry in situ basis.
Cut-off parameters	 The basis of the adopted cut-off grade(s) or quality parameters applied. 	The model has been reported at a cut-off grade of 2.0g/t Au. The reporting cut-off grade was selected based on a potential haulage and toll milling scenario being studied by Dreadnought.
Mining factors or assumptions	 Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. 	The shallow nature and high grade of the of the mineralisation suggests that the deposit could be mined with open pit mining techniques. Early-stage studies by Dreadnought based on third party processing have demonstrated reasonable potential for eventual economic extraction.
Metallurgical factors or assumptions	 The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. 	Metallurgical test work was carried out by Dreadnought in 2024. The metallurgical program assessed conventional gravity and CIL gold recovery at a range of grind sizes. The results confirm that exceptional gold recoveries are achieved using conventional gravity and CIL processing with total gold recovery of 97-99% and gravity gold recovery of 74%.
Environmental factors or assumptions	 Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported 	Environmental studies have been carried out on site with Level I and Level 2 Flora and Fauna surveys completed. No declared rare species or threatened ecological communities have been identified. Dreadnought will work to mitigate environmental impacts as a result of any future mining or mineral processing.

Criteria	JORC Code Explanation	Commentary
	with an explanation of the environmental assumptions made.	
Bulk density	 Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	Bulk density values applied to the Mineral Resource were based on a number of density determinations carried out on drill core. Competent core was tested using immersion methods. Bulk density applied to the model included Transitional 2.4t/m ³ , fresh 2.70t/m ³
	 The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. 	The Primeral Resource estimate is reported in compliance with the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' by the Joint Ore Reserves Committee (JORC). The detailed drilling at Star of Mangaroon is sufficient to confirm the continuity and extent of the mineralisation within the drilled extent of the deposit. There is limited drilling below the limit of the Mineral Resource. The mineralisation at Star of Mangaroon is constrained within a clearly defined horizon that can be identified in all drill holes in the deposit. This, coupled with the observations in surface workings confirms the continuity of the geology. The high quality drilling and sampling has provided intersections at spacings of 20-25m through the high grade portion of the deposit allowing that portion of the deposit to be classified as Indicated Mineral Resource. The parts of the deposit defined by drilling at greater than 25m spacings or where grade continuity could not be reasonably assumed have been classified as Inferred Mineral Resource Extrapolation of the mineralisation was generally limited to 25m along strike and down dip of drill hole intersections. The input data is comprehensive in its coverage of the mineralisation. The definition of mineralised zones is based on a high data density producing a robust model of the mineralised domain. The Mineral Resource estimate appropriately reflects the view of the Competent Person.
Audits or reviews	• The results of any audits or reviews of Mineral Resource estimates.	No audits have been completed.
Discussion of relative accuracy/ confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. 	The deposit geometry and continuity have been adequately interpreted to reflect the classification applied to the Mineral Resource. The data is of good quality and the drill holes have detailed logs produced by qualified geologists. A recognised laboratory has been used for all gold analyses. The Mineral Resource statement relates to global estimates of tonnes and grade after depletion for historic mine production.
