27.4m @ 1,314 g/t Silver Drilled at Elizabeth Hill

Bonanza Silver Grades up to 33,107 g/t (1,064 oz/t) over 0.35 m

Highlights

- Native silver intersected in multiple drill holes, with assays returning exceptionally high grades and broad zones of high-grade mineralisation.
- Silver mineralisation in 25WCDD019 highlights exploration opportunities further northwest than any prior drilling, suggesting the mineralised system is still open and may extend significantly along the strike.
- Furthermore, high grade drill results from 25WCDD019 and 25WCDD020 are hosted almost entirely in granite, unlike previous ultramafic dominated mineralisation, encouraging further exploration to the west of the main mineralised zone.

Hole ID	Length (m)	Ag (g/t)	Ag (oz/t)	From (m)
25WCDD014	**27.4**	**1,314**	**42**	49
including	**4.15**	**3,677**	**118**	52.85
included within	0.4	**16,291**	**524**	53.7
and included within	0.9	**5,290**	**170**	54.1
and including	0.28	**5,660**	**182**	66.15
and including	2.4	**7,288**	**234**	74
Included within	0.35	**33,107**	**1,064**	74.6
and included within	0.25	**17,534**	**564**	74.95
25WCDD019	**22**	**578**	**19**	6
including	0.9	**9,070**	**292**	9
25WCDD020	**25.8**	151	5	20
including	0.63	**1,590**	**51**	27.37
25WCDD022	1.95	**1,252**	**40**	54.6
including	1.2	**1,894**	**61**	54.6

Note: Lengths are down hole lengths not true widths; 1 oz = 31.1035g; results rounded to nearest whole number

- Results strengthen confidence in a laterally extensive, high-grade silver system and validate historical results.
- Assay results for 76 aircore drill holes for 1,060m completed in November 2025, expected mid-February 2026, with follow-up drilling planned.

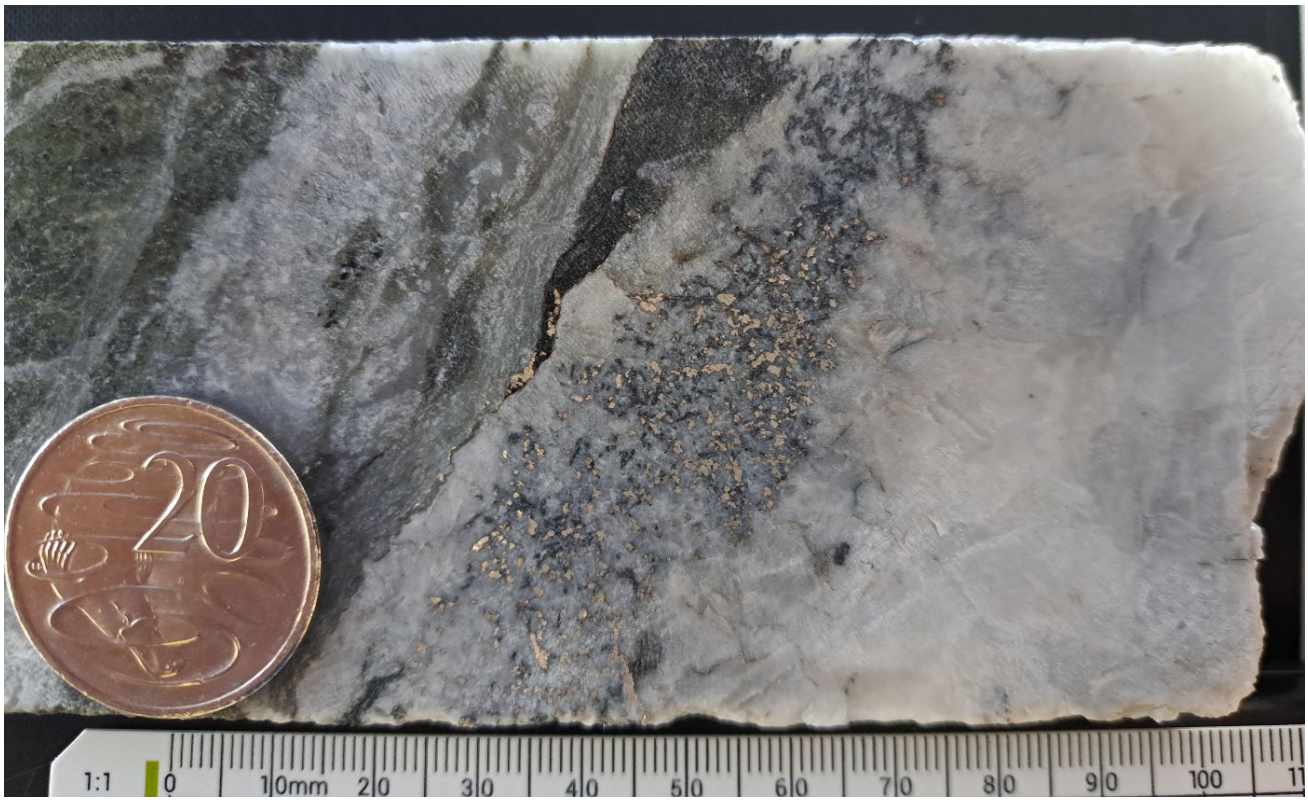

Photo 1: Photograph of sectioned and preserved half HQ3 drill core (25WCDD014) at 75.05m to 75.15m. This drill core shows 2mm to 4mm grains of native silver hosted within and adjacent to 5cm thick carbonate vein in an ultramafic host rock.

West Coast Silver Limited (ASX: WCE) ('West Coast Silver' or the 'Company') is pleased to advise assay results for diamond drill program (13 holes for 1,015.25m: 25WCDD013-025) have been received from the Phase 2 diamond drilling program at the Elizabeth Hill Joint Venture Project (WCE 70%, Alien Metals 30%) ('**Elizabeth Hill'**) near Karratha, Pilbara region of Western Australia (Figure 1, Figure 3).

Executive Director Bruce Garlick commented:

The Board is very encouraged by the results delivered from this Phase 2 drilling program at Elizabeth Hill. The confirmation of multiple near-surface and bonanza-grade silver intersections reinforces Elizabeth Hill's standing as one of Australia's highest-grade silver projects.

Of particular significance is the extension of high-grade mineralisation beyond the previously drilled footprint. ***High-grade silver intersected in drill hole 25WCDD019 further toward the northwest highlights the potential for the mineralised system to extend well beyond existing drilling, clearly indicating that the Elizabeth Hill trend remains open.***

In addition, the intersection of long intervals of mineralisation in ***25WCDD019*** *(****22.0m @ 578g/t Ag)*** *and* ***25WCDD020 (24.8m @ 151g/t Au)****, predominately intersected in the hanging wall granite is highly important for further exploration as mineralisation of this* ***magnitude has not previously recognised this far into the granite, opening up the likelihood of further granite hosted mineralisation****.*

The latest drilling has increased confidence in the scale potential of the silver mineralised system at Elizabeth Hill. The Board looks forward to updating shareholders as the Company advances the Project through the next phase of exploration in 2026.

DRILLING RESULTS

Nine of the 13 diamond drill holes intersected significant high-grade silver mineralisation. The highest-grade intersection was returned from drill hole **25WCDD014**:

- **27.4m @ 1,314g/t Ag (42 oz/t)** from 49m, including multiple bonanza-grade intervals.

Photo 1 demonstrates the distribution and form of silver mineralisation in drill hole 25WCDD014.

Further intervals of native silver identified in **25WCDD014** drill core (Photos 2 to 4 and WCE ASX Announcement dated 5 November 2025). The significant high-grade silver intersections include:

- **4.15m @ 3,677g/t Ag (118 oz/t)** from 52.85m down hole including **0.4m @ 16,291g/t Ag (524 oz/t)** from 53.70m and **0.9m @ 5,290g/t Ag (170 oz/t)** from 54.10m.
- **0.28m @ 5,660g/t Ag (182 oz/t)** from 66.15m down hole.
- **2.4m @ 7,288g/t Ag (234 oz/t)** from 74.00m down hole including **0.35m @ 33,107g/t Ag (1,064 oz/t)** from 74.6m and **0.25m @ 17,534g/t Ag (564 oz/t)** from 74.95m.

Drill hole 25WCDD014 intersected native silver in veins and stockworks and terminated in historical mine workings (Figure 1 and 2). The bonanza-grade results provide insight into the grades historically mined at Elizabeth Hill and indicate the presence of additional high-grade silver mineralisation beyond that previously interpreted from historical drilling.

Drill hole **25WCDD019** intersected a broad zone of near-surface silver mineralisation:

- **22.0m @ 578g/t Ag (19 oz/t) from 6m**, including **0.9m @ 9,070g/t Ag (292 oz/t)**

This hole was drilled on the northernmost drill line and intersected mineralisation further west than previously tested, suggesting a change in strike of the Munni Munni fault and indicating that mineralisation remains open to the northwest.

Drill hole **25WCDD022** intersected high-grade silver mineralisation, returning:

- **1.95m @ 1,252g/t Ag (40 oz/t) from 54.6m**, including **1.20m @ 1,894g/t Ag (61 oz/t)**

Mineralisation in 25WCDD022 was associated with sulphide-bearing carbonate veins in ultramafic rocks adjacent to historical stopes.

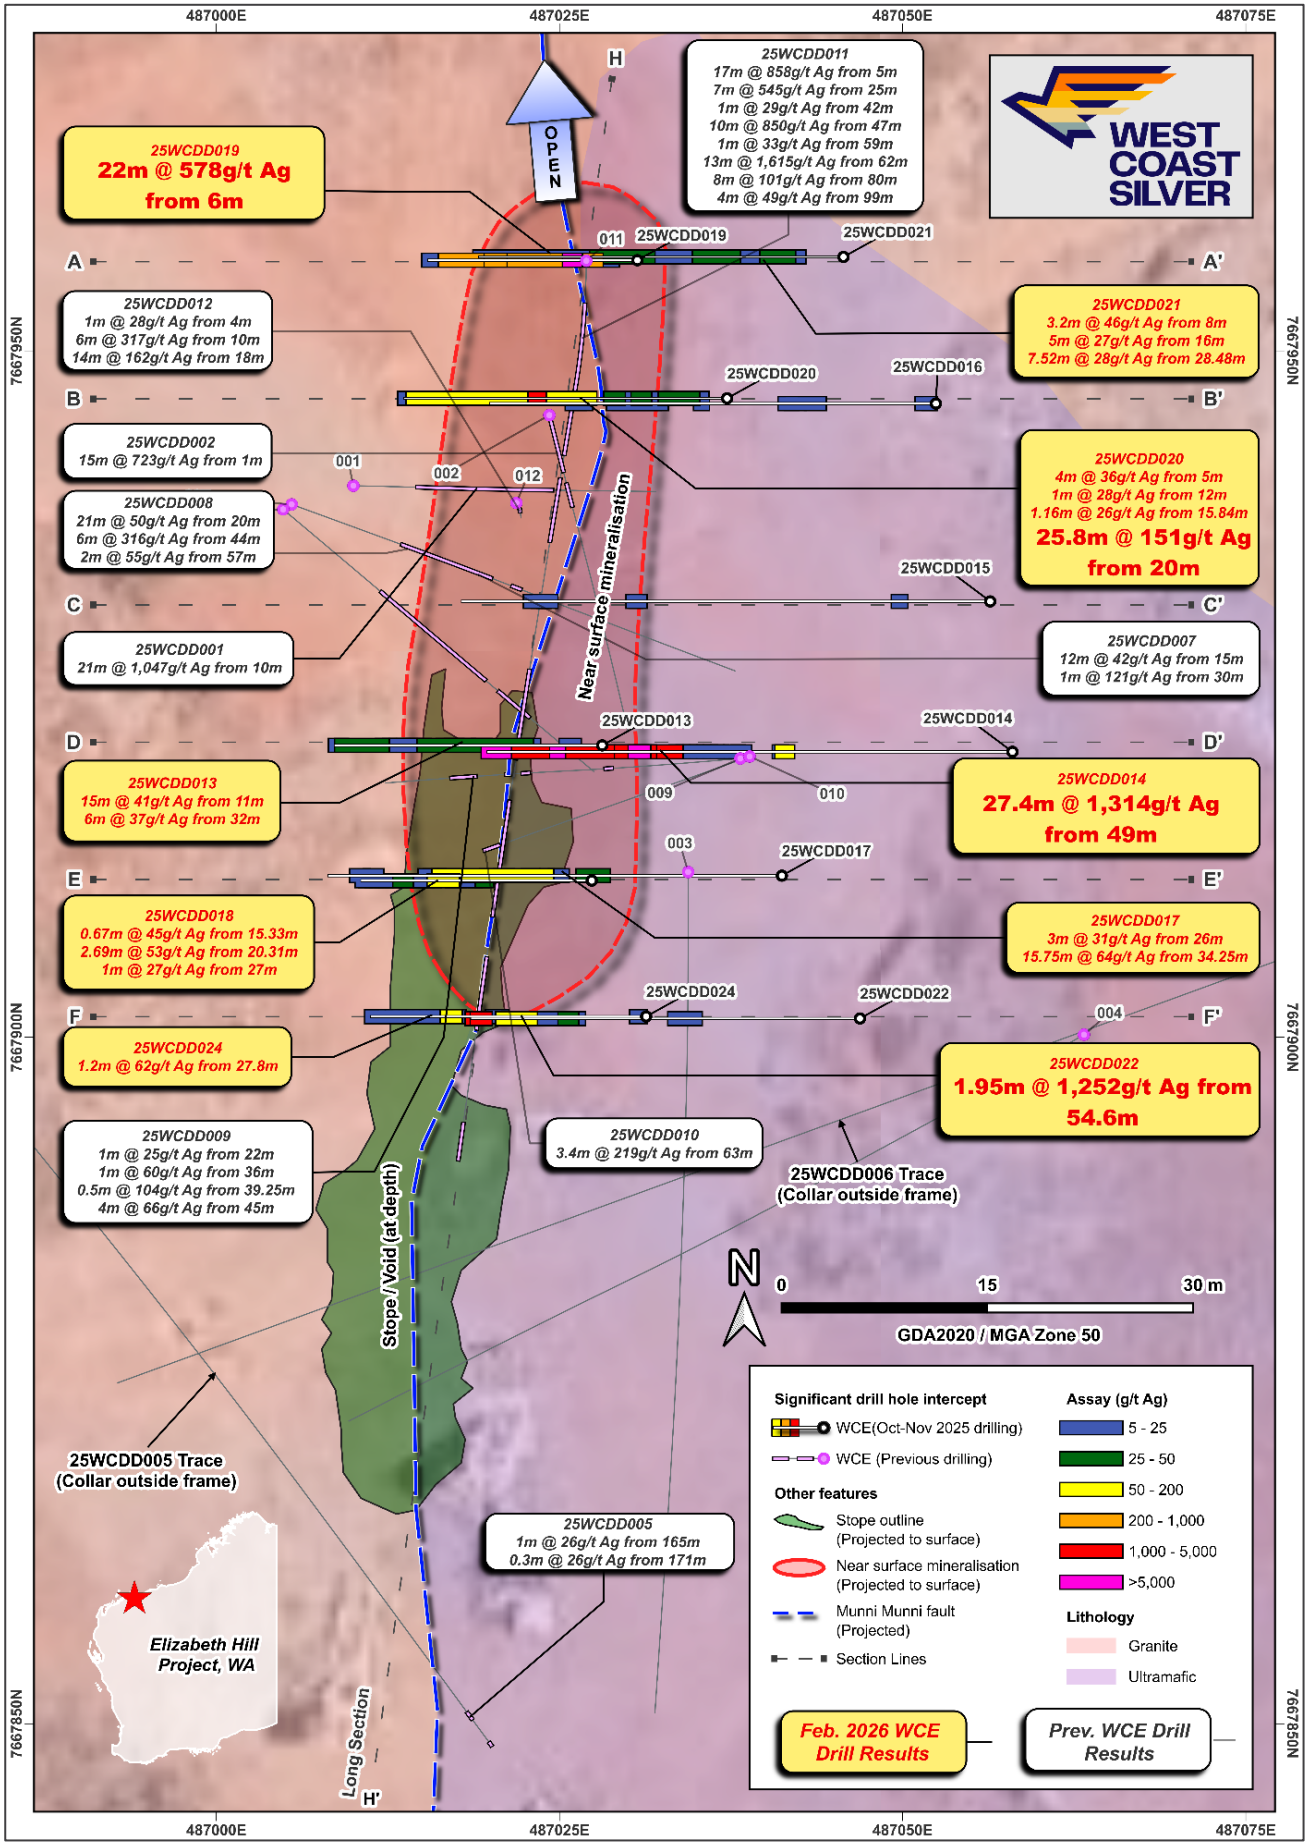

Figure 1: Location of significant silver intercepts in Phase 1 and 2 Elizabeth Hill 2025 diamond drill holes

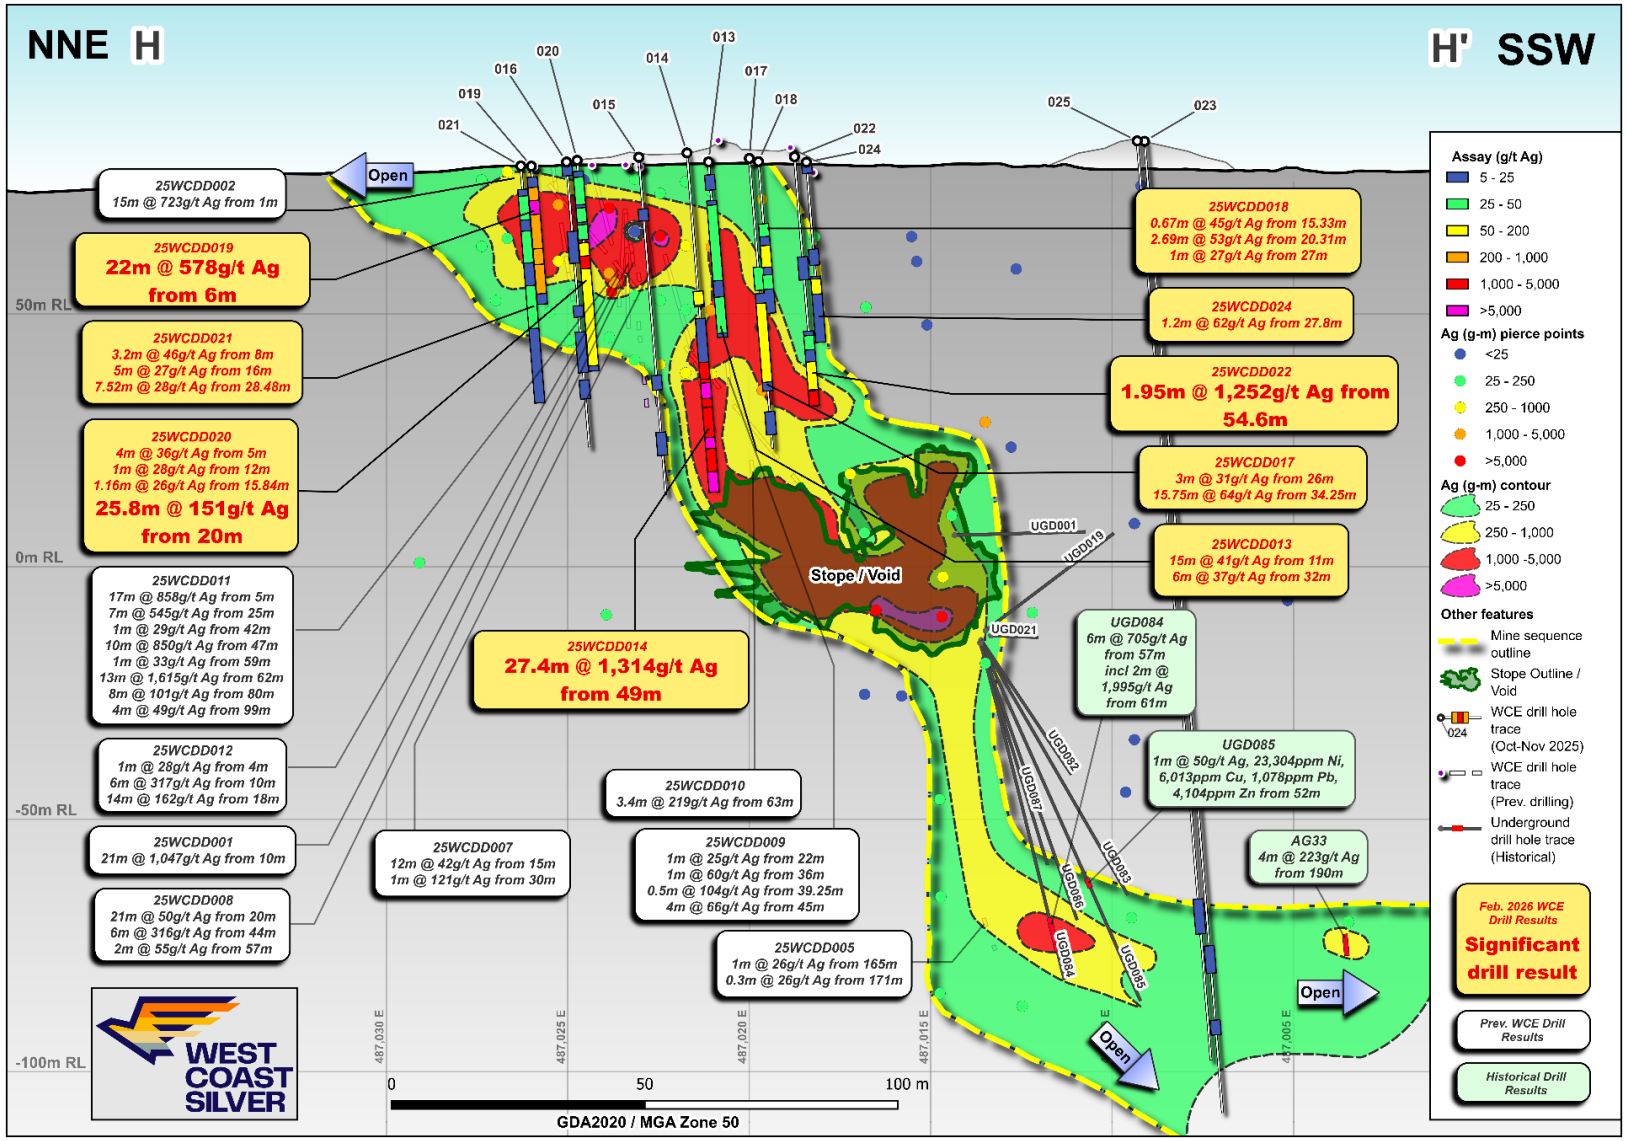

Figure 2: Long section highlights the southerly plunge of silver mineralization from gram-metre plot (grade g/t Ag x intercept m's) of all drilling results. Elizabeth Hill silver deposit highlighting the significant assay drill results. *Note: Phase 2 diamond drill hole traces (25WCDD013-025) are shown in their entirety and are projected onto the long section plane.*

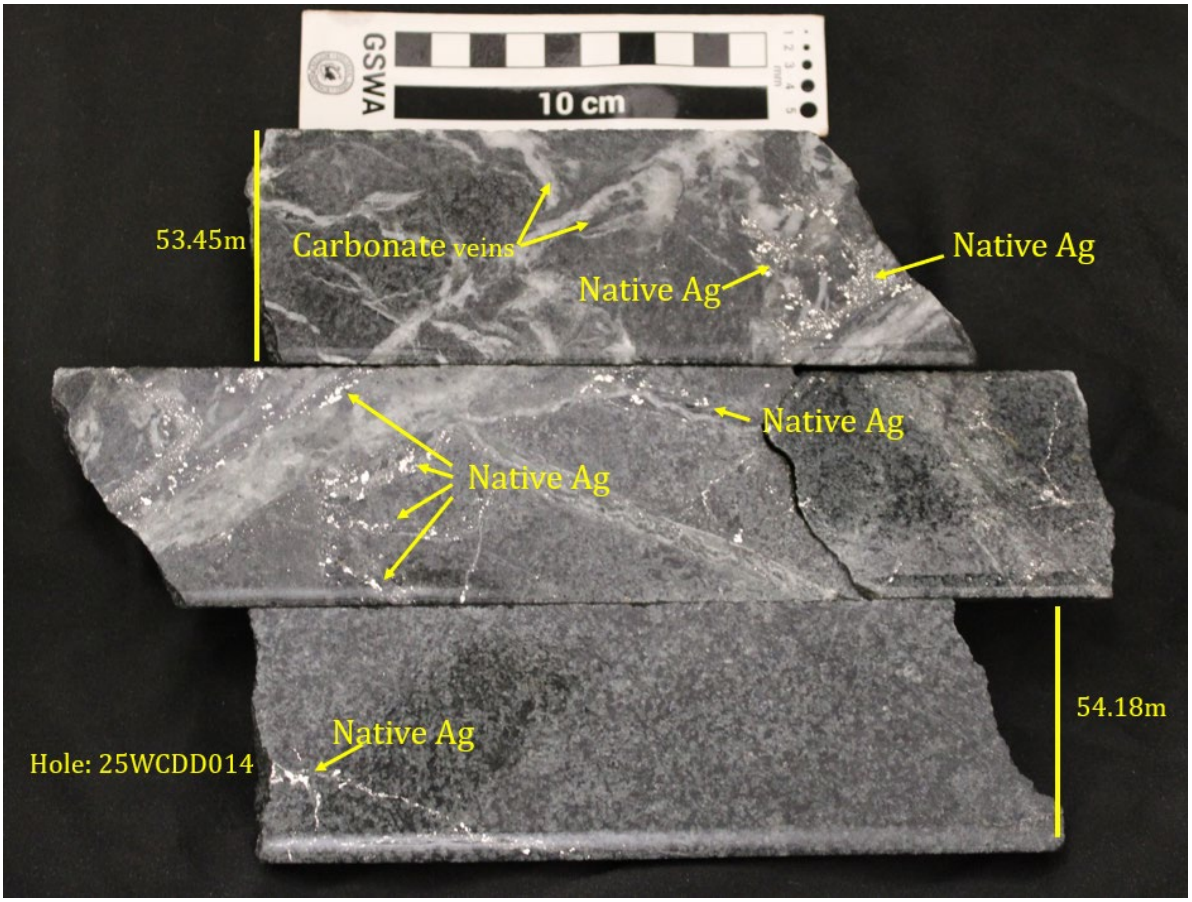

Photo 2: Photograph of cut half HQ3 drill core (25WCDD014) from 53.45m to 54.18m showing 2mm to 4mm grains of native silver hosted within and adjacent to 1cm to 3cm thick carbonate veins in an ultramafic host rock.

Note: Intervals shown in the photo are contained within the assay intervals in the text above, but do not show the entire interval.

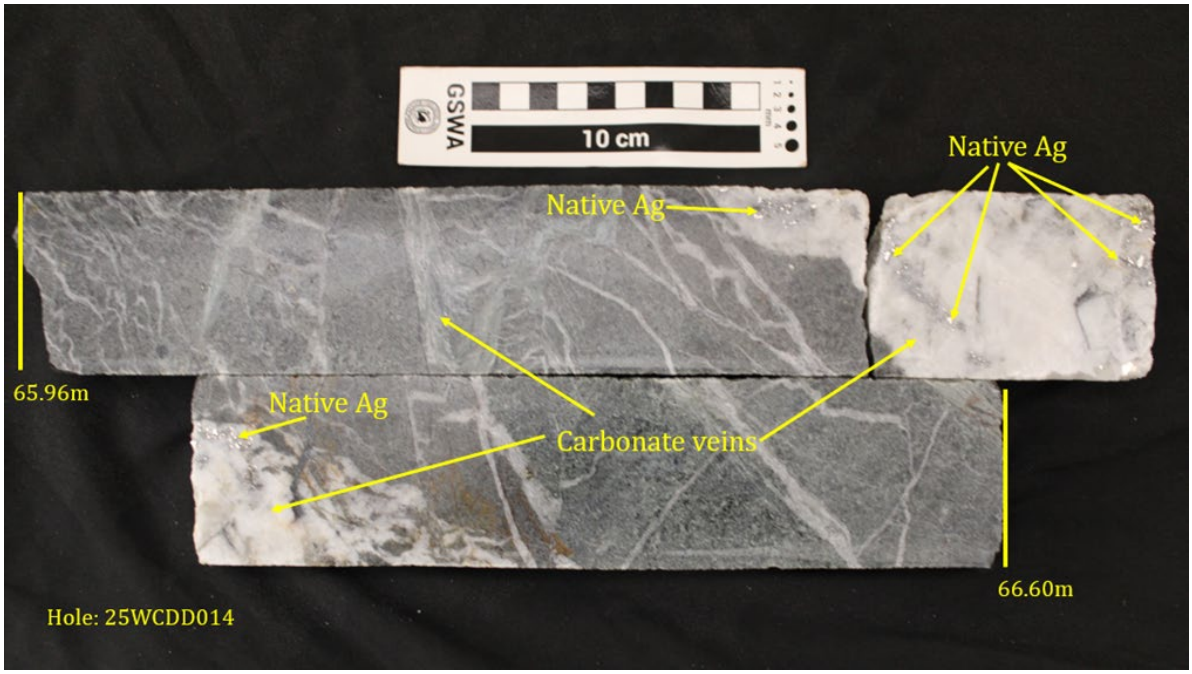

Photo 3: Photograph of cut half HQ3 drill core (25WCDD014) from 65.96m to 66.60m showing 1% visually estimated, 2mm to 3mm long native silver grains hosted in and adjacent to 1cm to 10cm thick carbonate veins in an ultramafic host rock.

Note: Intervals shown in the photo are contained within the assay intervals in the text above, but do not show the entire interval.

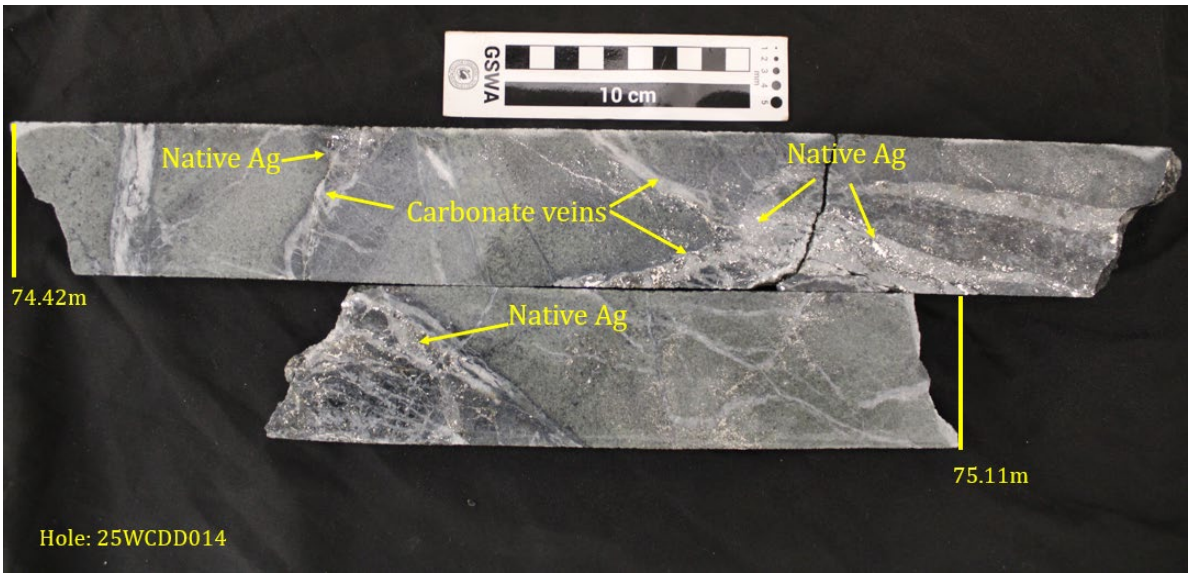

Photo 4: Photograph of cut half HQ3 drill core (25WCDD014) from 74.42m to 75.11m showing 1% visually estimated, 2mm to 4mm long native silver grains hosted within and adjacent to 1cm to 3cm thick carbonate veins in an ultramafic host rock.

Note: Intervals shown in the photo are contained within the assay intervals in the text above, but do not show the entire interval.

EXPLORATION IMPLICATIONS

The drilling has confirmed extensive high-grade silver mineralisation close to surface and immediately above historical mine workings. The results support West Coast's interpretation that the southerly plunge of silver mineralisation broadens as it flattens and approaches surface, creating additional near-surface targets for further exploration (Figure 2).

High-grade silver intercepts in drill hole 25WCDD019 represent the most north-westerly mineralisation intersected to date. The change in the strike of mineralisation corresponds with an interpreted change in the direction of the Munni Munni fault, indicating the mineralised trend remains open to the northwest and may host additional high-grade silver mineralisation.

The consistency of high-grade results validates historical drilling and provides confidence to expand exploration beyond the historically mined areas.

NEXT STEPS

Following the high-grade results intersected in the 2025 diamond drilling programs (Phase 1 and 2), the Company will progress exploration at Elizabeth Hill in a structured and disciplined manner.

- **Results from the 76-hole (1,060m) aircore drill program** completed in November 2025. Pending results are expected in mid-February 2026. It is anticipated the results will further refine targets for near-surface silver mineralisation and prioritising follow-up RC and diamond drilling.
- **Detailed geological and structural review** of all 2025 drilling data, including the interpreted change in strike and plunge of mineralisation, particularly the newly identified targets in the northwest of the Elizabeth Hill Project. Planning of follow-up drilling, subject to results and approvals, targeting near-surface and near-mine extensions of known mineralisation.
- **Further drilling planned** targeting on:
  - extensions of high-grade mineralisation along strike and at depth.
  - near-mine targets adjacent to historical workings.
  - priority targets identified from aircore drilling and the new geological reinterpretation.
- **Surface and down-hole geophysical surveys** to improve targeting and support drill planning during 2026.
- **JORC Mineral Resource Estimate and economic study of near surface mineralisation** being undertaken to support ongoing evaluation of a development pathway.

About The Elizabeth Hill Project

Elizabeth Hill is historically one of Australia's highest grade silver projects and has a proven production history outlined below:

- **High grades enabled low processing tonnes:** 1.2Moz of silver was produced from just 16,830t of ore at a head grade of 2,194g/t (70.5 oz/t Ag)[1].
- **Previous mining operation ceased in 2000:** because of low silver prices (US$5)[2].
- **Simplistic historical processing technique: native silver** was recovered via **low-cost** gravity separation techniques.
- **Untapped potential remains** in ground with deposit open at depth and recent consolidation of land package offers potential to discover more Elizabeth Hill style deposits.
- **Tier 1 Mining Jurisdiction located on a mining lease** with potential processing option at the nearby Radio Hill site. Radio Hill is a **third party-owned** processing facility; WCE has **no current agreement in place**.

Through the consolidation of the surrounding land packages into a single contiguous 180km^2 package significant exploration and growth potential exists both near mine and regionally. The land package holds a significant portion of the Munni Munni fault system, and other fault systems subparallel to the Munni Munni fault system, which are considered prospective for Elizabeth Hill look-a-like silver deposits.

Competent Person Statement

The information in this announcement that relates to Exploration Results is based on information reviewed by Mr Max Nind who is a Member of the Australian Institute of Geoscientists. Mr Nind is a consultant to West Coast Silver and a full-time employee of ERM Australia Consultants Pty Ltd.

Mr Nind has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves', and a Specialist under the VALMIN Code 2015 Edition of the 'Australasian Code for Public Reporting of Technical Assessments and Valuations of Mineral Assets'. Mr Nind consents to the inclusion in the announcement of the matters based on this information and in the form and context in which it appears.

Forward-Looking Statements

Statements in this announcement which are not statements of historical facts, including but not limited to those relating to the proposed transaction, are forward-looking statements. These statements instead represent management's current expectations, estimates and projections regarding future events. Although management believes the expectations reflected in such forward-looking statements are reasonable, forward-looking statements are based on the opinions, assumptions and estimates of management at the date the statements are made and are subject to a variety of risks and uncertainties and other factors that could cause actual events or results to differ materially from those projected in the forward-looking statements.

Accordingly, investors are cautioned not to place undue reliance on such statements.

CROSS SECTIONS

Drill Holes 25WCDD019 and 25WCDD021

Drill holes 25WCDD019 and 25WCDD021 were designed to test near surface mineralisation at the ultramafic-granite contact where it is intersected by the subvertical Munni Munni Fault (Figures 1, 2 and 4).

Drill hole 25WCDD019 was designed to twin historical reverse circulation percussion (RC) drill hole EC079, intersected silver mineralisation hosted within carbonate veins and iron-oxide rich veinlets, with associated malachite and black sulphide minerals, as previously reported (refer to WCE ASX Announcement dated 5 November 2025). Assay results returned a significant intersection of **22m @ 578g/t Ag** from 6m, including **0.9m @ 9,070g/t Ag** from 9m.

The wide intersection of silver mineralisation in 25WCDD019 within the Munni Munni Fault and its hangingwall validates the silver mineralisation in EC079 and extends it by another 8m down hole beyond the end of historical drilling. The results indicate that mineralisation remains open to the northwest along a flexure in the Munni Munni fault, with further drilling required to test this interpretation.

Drill hole 25WCDD021 was designed to target mineralisation east and below historical RC hole EC080 (Figure 4). The significant intersections in the drill hole confirm the targeting criteria and include **3.2m @ 46g/t Ag** from 8m, **5m @ 27g/t Ag** from 16m and **7.52m @ 28g/t Ag** from 28.48m.

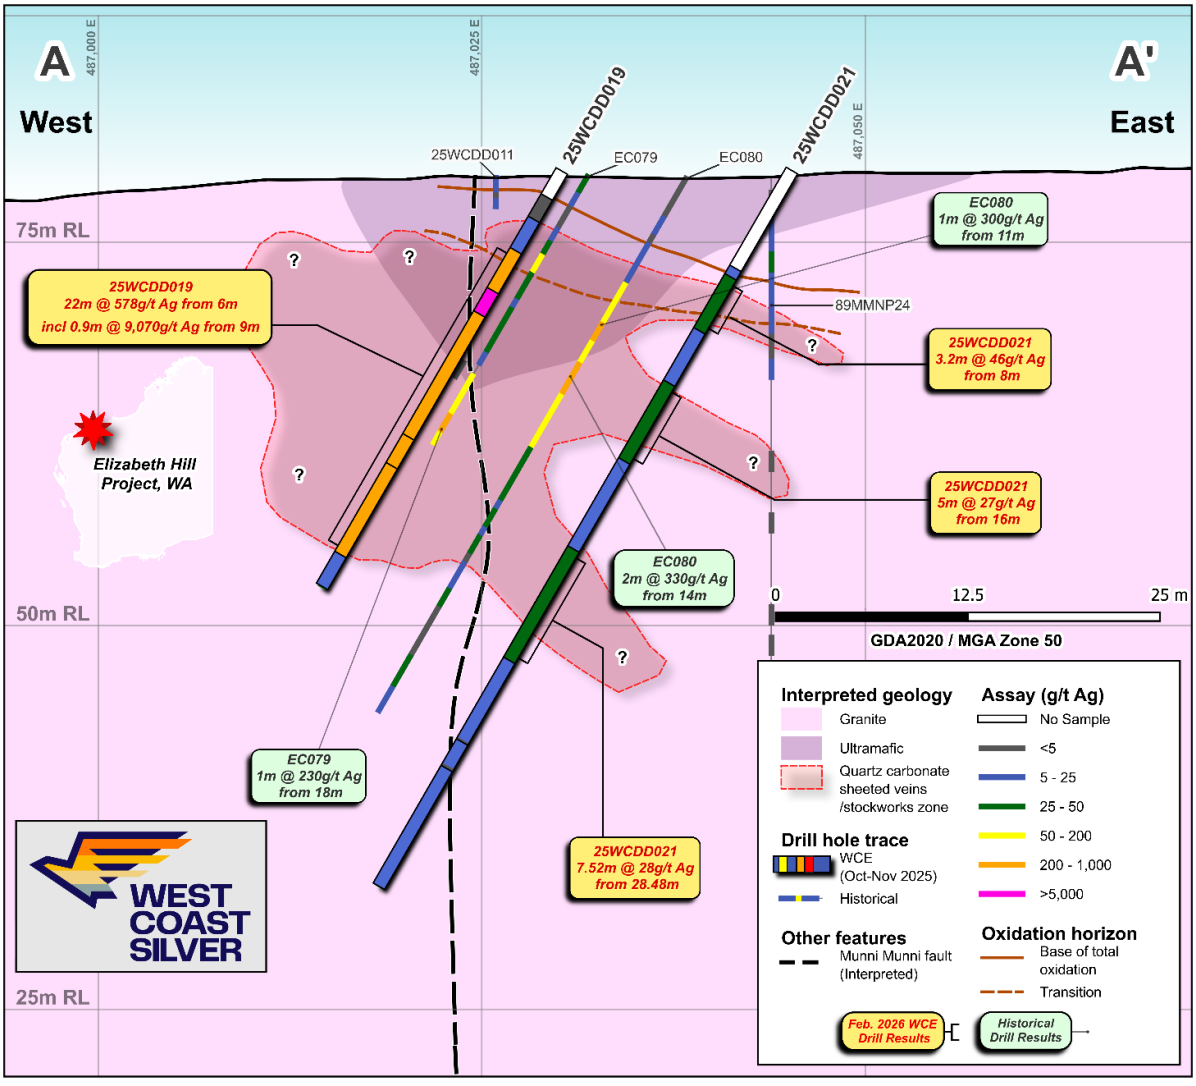

Figure 4: Cross section A-A' - 2025 drill holes 25WCDD019 and 25WCDD021 and historical drilling assay results. The dip of mineralisation and sheeted vein/stockwork zone may be an apparent dip due to the Munni Munni fault flexing northwest.

Drill Holes 25WCDD016 and 25WCDD020

Drill holes 25WCDD016 and 25WCDD020 were designed to test the interaction of the Munni Munni fault and granite-ultramafic contact in the northern up-plunge position of the Elizabeth Hill mineralisation (Figures 1, 2 and 5). These drill intersections represent the oxidised expression of the deeper native silver and silver sulphide mineralisation.

Drill hole 25WCDD020, drilled to twin historical RC drill hole EC072, intersecting both primary and secondary silver minerals associated with carbonate veins at shallow depth, with silver mineralisation and minor galena and sphalerite within a brecciated, quartz-veined zone. Assay results of **4m @ 36g/t Ag** from 5m, **1m @ 28g/t Ag** from 12m, **1.16m @ 26g/t Ag** from 15.84m, and **25.8m @ 151g/t Ag** from 20m broadly confirm historical results and extend mineralisation to greater depth and further west.

Drill hole 25WCDD016 intersected low-grade silver mineralisation up to 21.9g/t Ag associated with iron oxide minerals in a carbonate matrix (Appendix 3) (WCE ASX Announcement dated 5 November 2025). The Company interprets the main silver mineralisation to plunge to the south, with **25WCDD016** intersecting below the interpreted plunging mineralised zone.

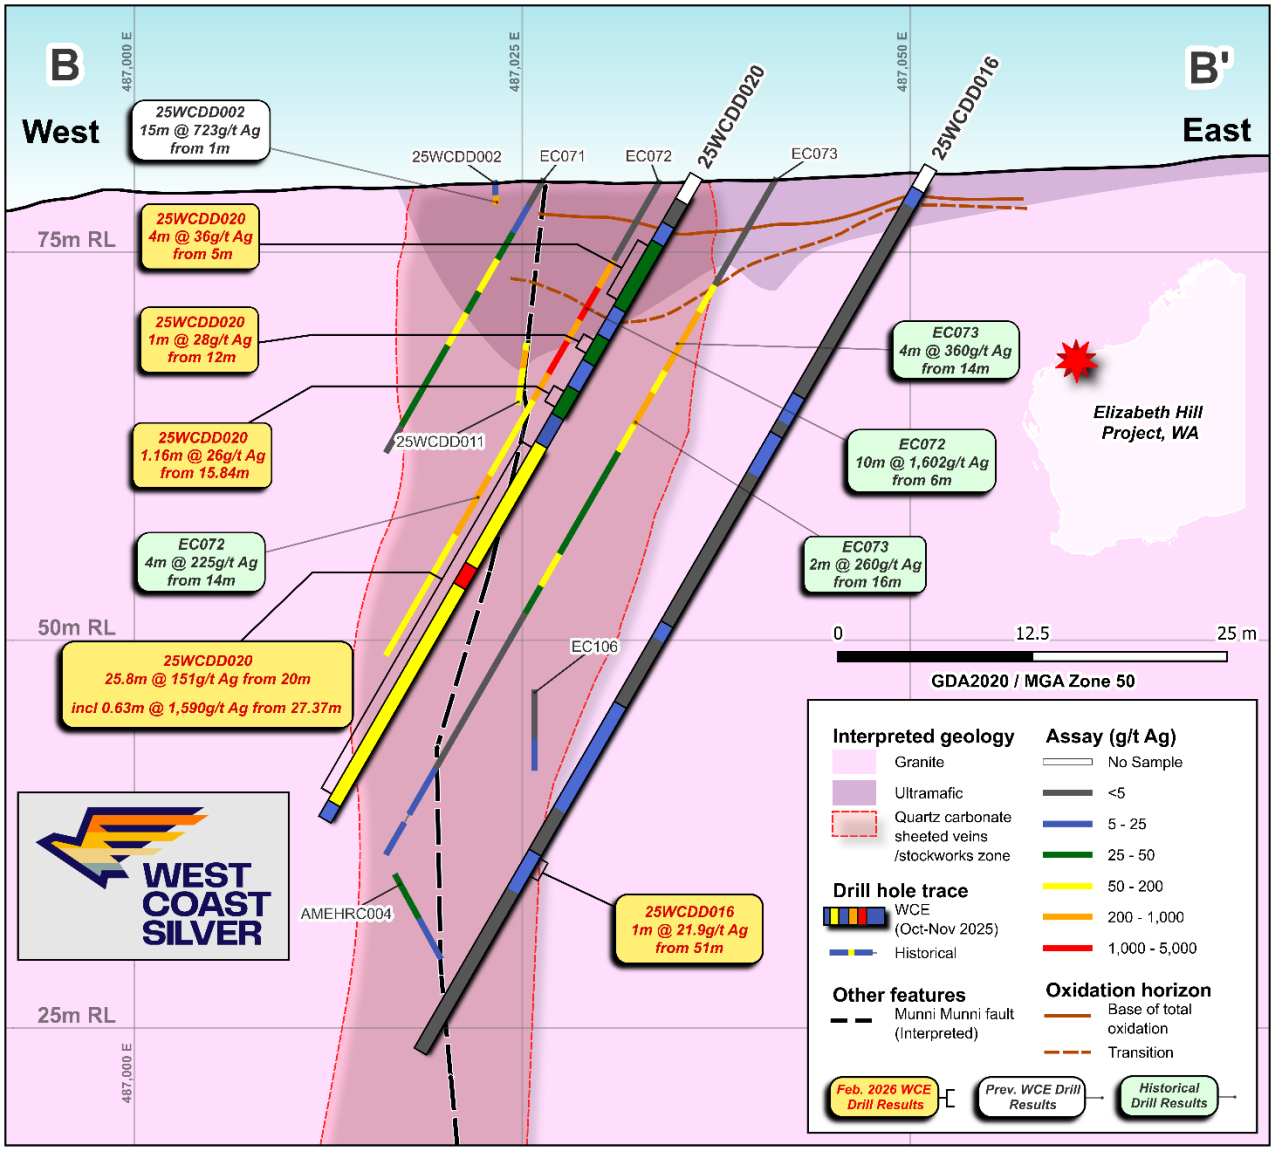

Figure 5: Cross section B-B' - 2025 drill holes 25WCDD016 and 25WCDD020 and historical drilling assay results

Drill Hole 25WCDD015

Drill hole 25WCDD015 was designed to test for down-plunge extensions of high-grade silver mineralisation along the Munni Munni fault (Figure1, 2 and 6). This drill hole intersected intensely silicified granite within the fault zone and at the ultramafic-granite contact with no significant silver mineralisation intersected. WCE interprets the silver mineralisation in the upper parts of the section plunges to the south, with 25WCDD015 intersected below the interpreted plunging mineralised zone.

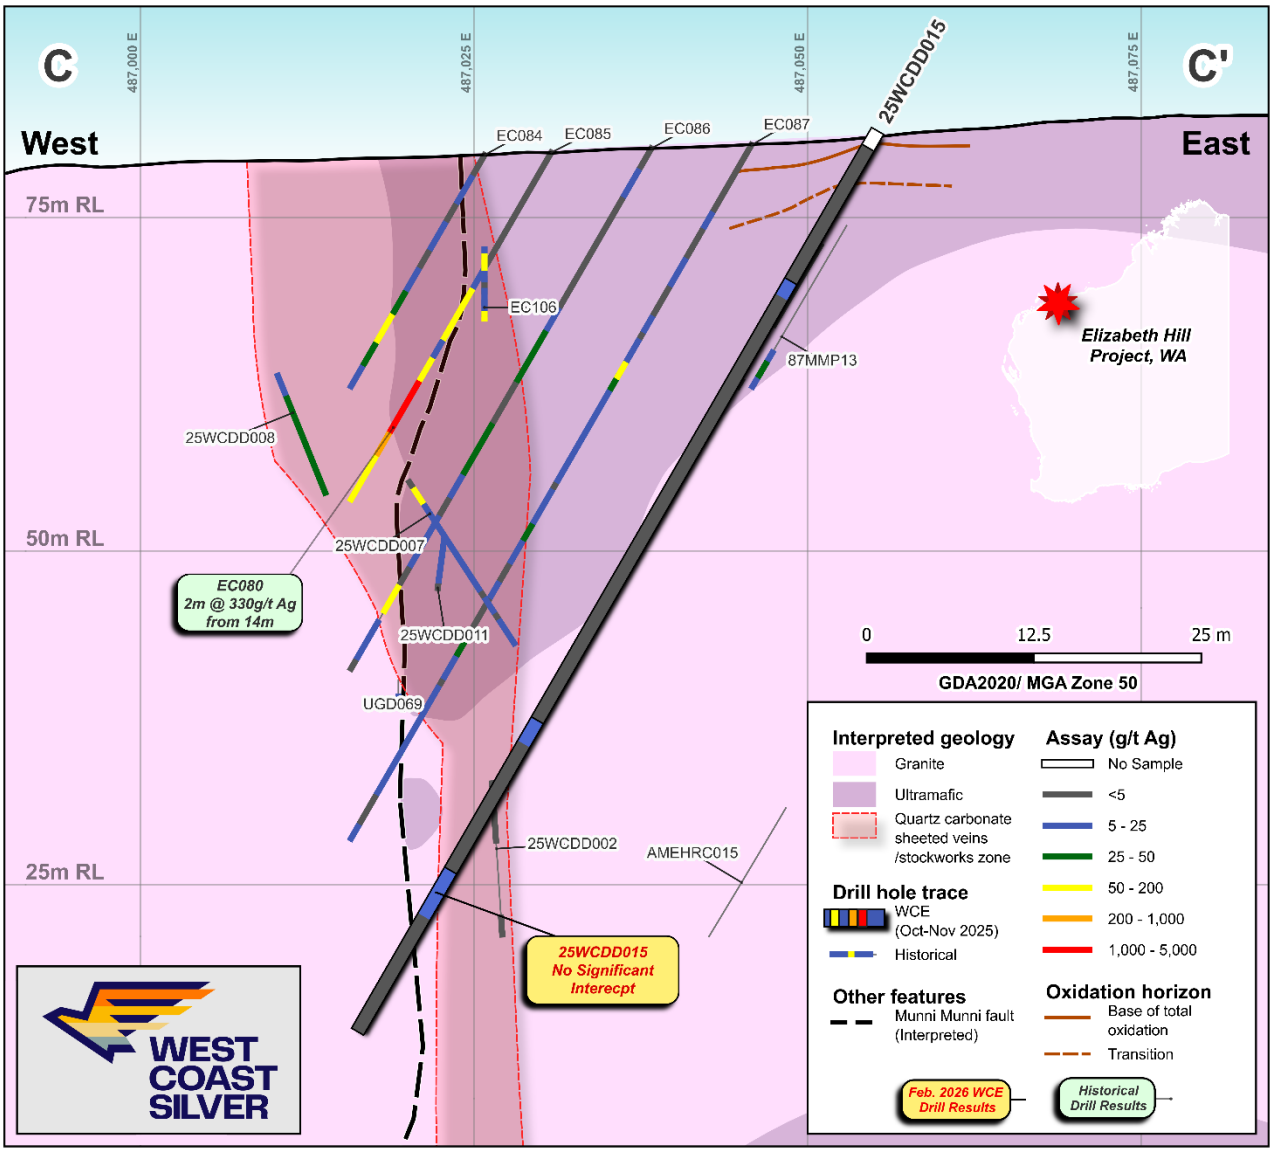

Figure 6: Cross section C-C' - 2025 drill hole 25WCDD015 (NSI) and historical drilling assay results

Drill Holes 25WCDD013 and 25WCDD014

Drill holes 25WCDD013 and 25WCDD014 targeted the interaction of the Munni Munni fault and granite-ultramafic contact, and mineralisation at the upper portion of the Elizabeth Hill mine sequence (Figures 1, 2 and 7).

Drill hole 25WCDD014 targeted extensions of mineralisation to the east and beneath historical RC drill hole EC097. Geological logging identified three intervals with native silver hosted within and adjacent to carbonate veins, as previously reported (WCE ASX Announcement dated 5 November 2025). These logging observations supported by assay results include:

- **27.4m @ 1,314g/t Ag** from 49m down hole.
  - including **4.15m @ 3,677g/t Ag** from 52.85m.
    - included within **0.4m @ 16,291g/t Ag** from 53.70m and **0.9m @ 5,290g/t Ag** from 54.10m.
  - including **0.28m @ 5,660g/t Ag** from 66.15m.
  - including **2.4m @ 7,288g/t Ag** from 74.00m.
    - included within **0.35m @ 33,107g/t Ag** from 74.6m and **0.25m @ 17,534g/t Ag** from 74.95m.

Drill hole 25WCDD013, drilled as a twin to historical RC drill holes EC094 and EC095, intersected oxidised carbonate-quartz veins and secondary minerals consistent with historical observations. Assay results of **15m @ 41g/t Ag** from 11m down hole **and 6m @ 37g/t Ag** from 32.00m down hole confirm the historical drilling results.

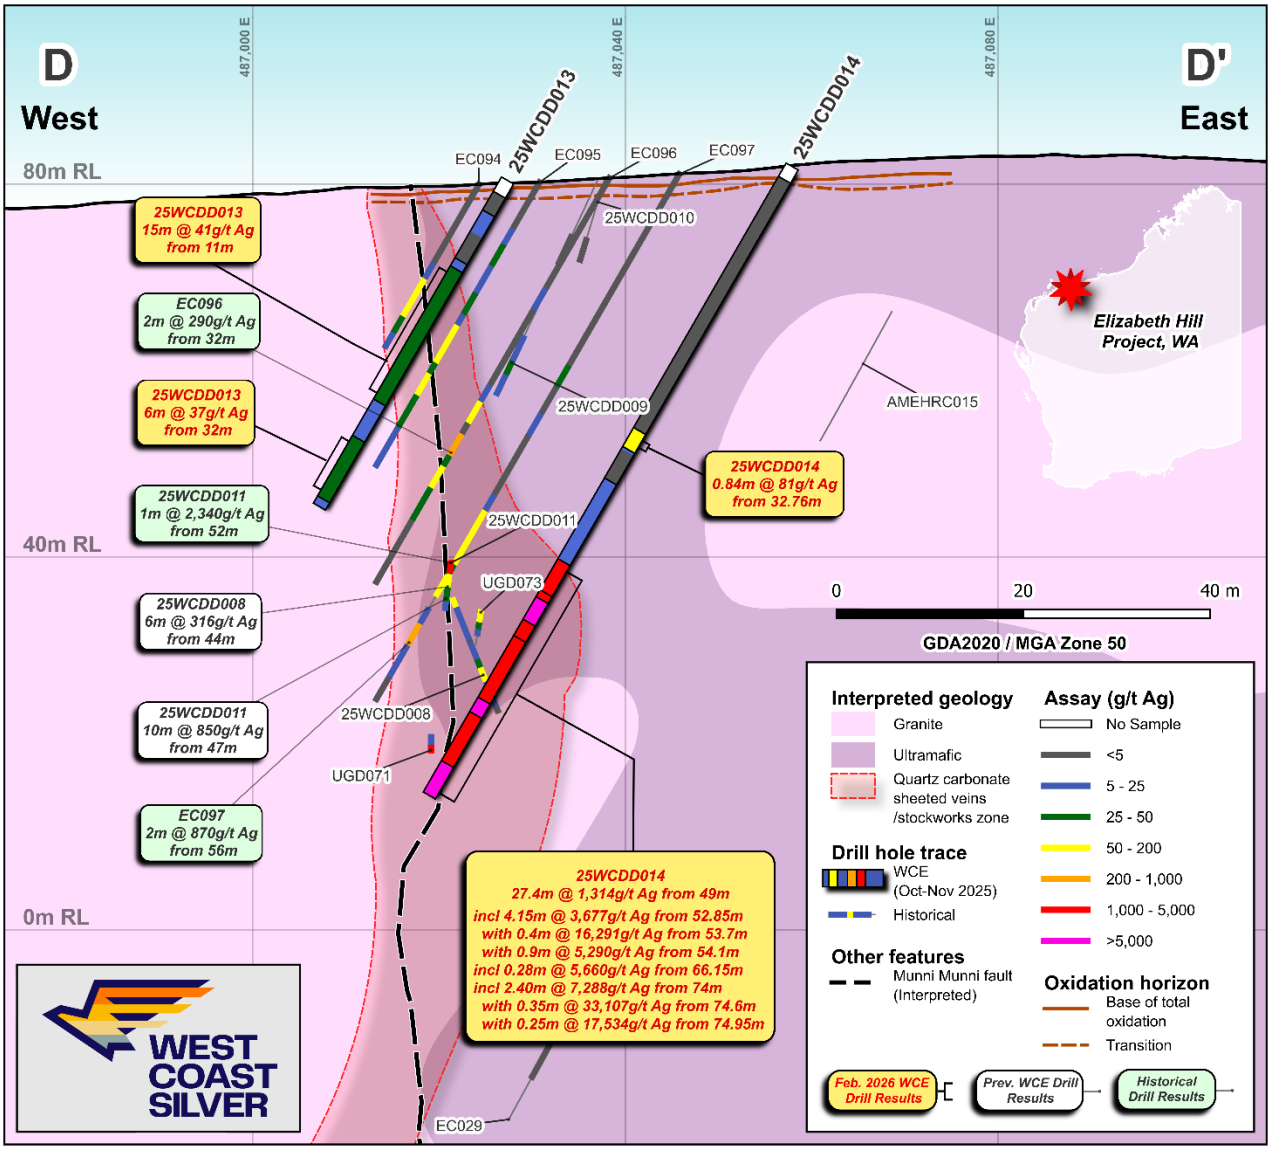

Figure 7: Cross section D-D' - mineralisation outline and silver mineralisation in 25WCDD013 and 25WCDD014

Drill Holes 25WCDD017 and 25WCDD018

Drill holes 25WCDD017 and 25WCDD018 were designed to test the ultramafic-granite contact and Munni Munni fault (Figures 1, 2 and 8).

Drill hole 25WCDD017, drilled as a twin to historical RC drill hole EC100, intersected silver mineralisation including trace native silver, occurring as 1mm to 2mm grains at 43.61m within a quartz vein in a late fracture (refer to WCE ASX Announcement dated 5 November 2025). The drill hole intersected **3m @ 31g/t Ag** from 26m down hole, and **15.75m @ 64g/t Ag** from 34.25m down hole validating the historical results in EC100 (Figure 8).

Drill hole 25WCDD018, drilled as twin to historical RC hole EC098, intersected silver mineralisation with galena and jarosite at 21.43m (refer to WCE ASX Announcement dated 5 November 2025) with significant intersections including **0.67m @ 45g/t Ag** from 15.33m down hole, **2.69m @ 53g/t Ag** from 20.31m down hole, and **1m @ 27g/t Ag** from 27m down hole confirming the historical silver mineralisation intersected in EC098 (Figure 8).

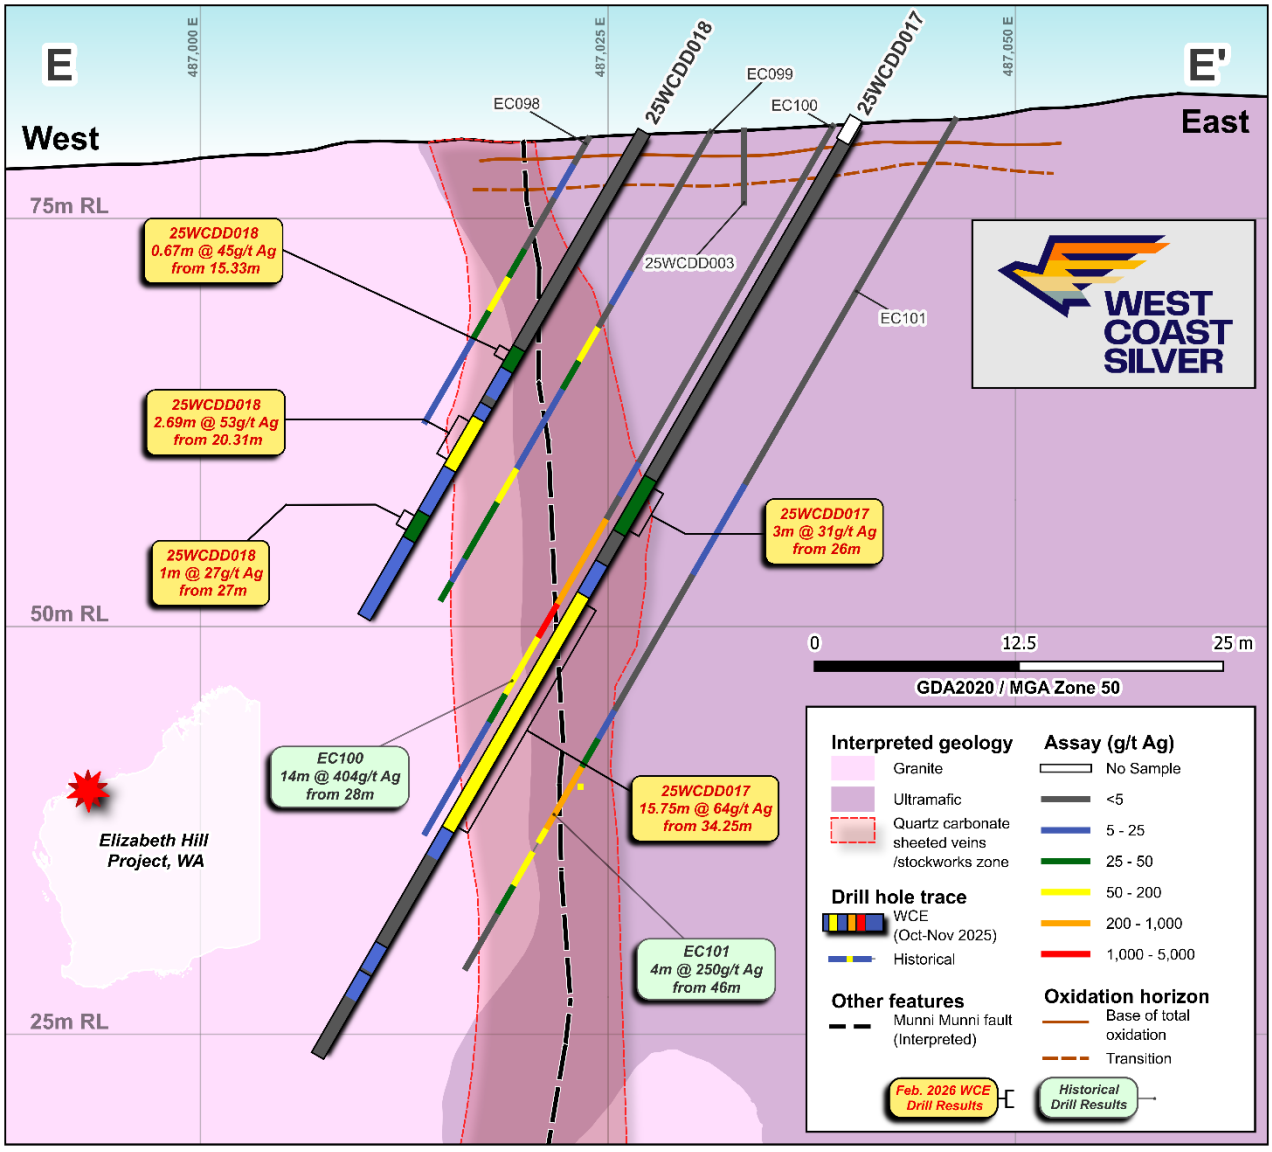

Figure 8: Cross section E-E' - 2025 drill holes 25WCDD017 and 25WCDD018 and historical drilling assay results

Drill Holes 25WCDD022 and 25WCDD024

Drill holes 25WCDD022 and 25WCDD024 were designed to test the vertical ultramafic-granite contact and the Munni Munni fault at Elizabeth Hill (Figure 1, 2 and 9).

Drill hole 25WCDD022 was targeted to twin historical RC drill hole EC105, intersected silver sulphide mineralisation at 54.95m, with silver mineralisation associated with sphalerite between 55.75m and 55.90m. Assay results returned multiple silver intersections including **1m @ 40g/t Ag** from 42m down hole, **4.1m @ 91g/t Ag** from 48m down hole and high-grade intersection of **1.95m @ 1,252g/t Ag** from 54.60m down hole that includes **1.2m @ 1,894g/t** Ag from 54.60m down hole. These results validate the historical silver intersection in EC105.

Drill hole 25WCDD024 drilled as a twin of historical RC hole EC112. No visible silver mineralisation was identified during the logging; however, assay results returned a silver intersection of **1.2m @ 62g/t Ag** from 27.8m down hole, confirming the historical intersection in RC hole EC112.

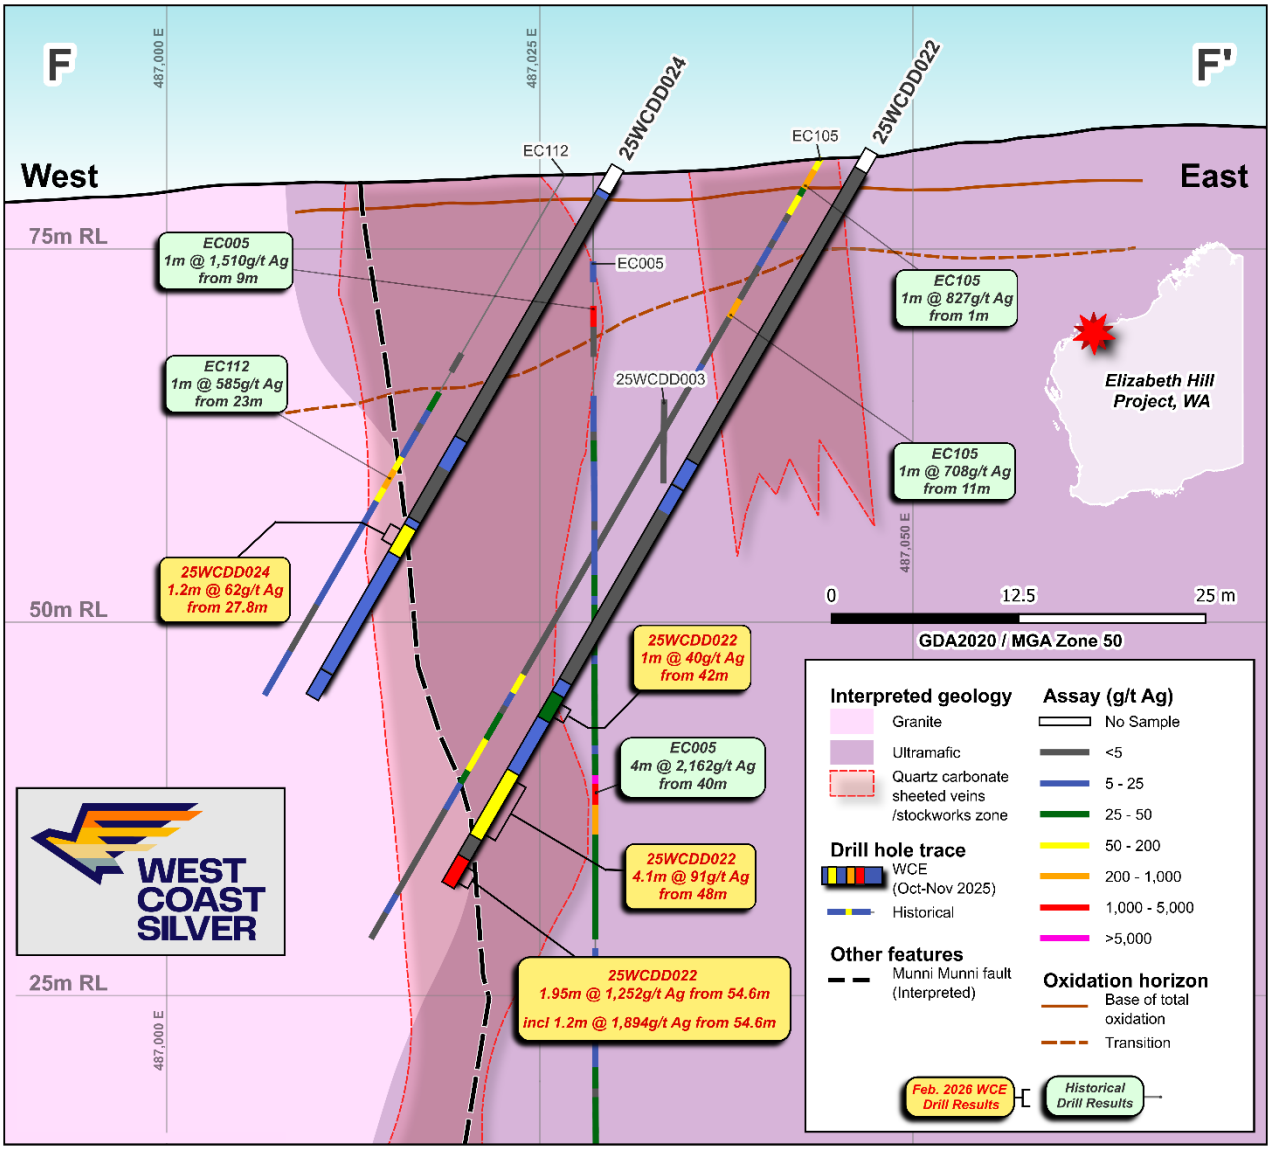

Figure 9: Cross section F-F' - 2025 drill holes 25WCDD022 and 25WCDD024 and historical drilling assay results

Drill Holes 25WCDD023 and 25WCDD025

Drill holes 25WCDD023 and 25WCDD025 were designed to test the ultramafic-granite contact and Munni Munni fault below and to the south of the historical underground workings (Figure 1, 2 and 10).

Drill hole 25WCDD025 intersected an extensive sheeted and stockwork vein system and silicified alteration zone between 174.45m and 208.55m, returning lower grade silver mineralisation up to **15.7g/t Ag.**

Drill hole 25WCDD023 intersected sheeted quartz-carbonate between 195.00m and 202.00m, with silicified alteration of granite intersected between 204.00m and 217.00m. Low-grade silver mineralisation up **12.25g/t Ag** was returned.

The low-grade Ag mineralisation in 25WCDD023 and 25WCDD025 is consistent with the lower grade halo mine sequence peripheral to the high-grade intercept reported in historical diamond drill hole UGD84 (**2m @ 1,995g/t Ag** from 61m down hole).

Note: intervals are down hole lengths not true widths; 1oz = 31.1035g

Appendix 3: JORC Code, 2012 – Table 1 - Elizabeth Hill October 2025 Diamond Drill Assay Results

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	• Samples for laboratory analyses were taken by sawing the diamond drill (DD) core in half along a cutting line, which is offset from the core orientation line. The half of the drill core without the orientation line was collected for assaying. Duplicate samples were collected by sawing the remaining half core into two quarter cores, taking a quarter core for the assay and preserving the quarter core with the orientation line. Sample length was typically 1m but could be as high as 1.3m and as low as 20cm. The short sample lengths were designed to separately capture the zones of visible native silver mineralisation. Original and QAQC samples (CRM standards, blanks and core duplicates) were sent to the laboratory for analysis (ALS Perth for all elements and secondary assaying at ALS Langley Canada for any over grade Ag assays). • Entire DD samples were fine crushed (CRU-42a) to 90% passing 3.15mm. The sample was then rotary split directly from the crusher (SPL-22a) and pulverised to obtain 750g to 85% passing 75 µm (method PUL-25e). These preparation methods are industry standard and appropriate for the samples.
Drilling techniques	• Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	• Drilling was undertaken with a track-mounted LF90 diamond core drill rig capable of drilling HQ core to 600m. Core was recovered in a triple tube. All the core in this program was drilled HQ3. • The drill rig was lined up on the proposed dip and azimuth by the drillers using an Azimuth Aligner instrument. • Core was orientated using Reflex ACT III HQ tool. • Drill hole collars were surveyed using an IMDEX TN14 Gyro and Differential GPS. • A Reflex Omni X-42 North Seeking Gyro was used for downhole surveying of the drill holes and was calibrated prior to use, with readings taken at approximately every 5m on the in and out run.
Drill sample recovery	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	• Core recovery was systematically recorded from the commencement of diamond coring to the end of hole, by reconciling against driller depth blocks, production plods and knowledge obtained from visual inspection. • Core recoveries typically averaged above 90% with isolated minor zones of lessor recovery. • No relationship has been established between core recovery and grade. There is no reason to expect any sampling bias. • Detailed core recovery data was noted throughout the drilling by the drilling crew and confirmatory

Criteria	JORC Code explanation	Commentary
		measurements were collected and recorded by the geologist as part of the geotechnical logging.
Logging	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged.	• Diamond drill core was orientated and geologically and geotechnically logged for the entire drill hole by an experienced team of geologists with the data stored in a database. • All core logging was both qualitative and quantitative in nature. • Photographs are taken prior to the cutting and sampling of the core; core is wetted to improve the visibility of features in the photographs.
Subsampling techniques and sample preparation	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all subsampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	• Samples for laboratory analyses were taken by sawing the DD core in half along a cutting line, which is offset from the core orientation line. The half of the drill core without the orientation line was collected for assaying. Duplicate samples were collected by sawing the remaining half core into two quarter cores, taking a quarter core but preserving the quarter core with the orientation line. Original and QAQC samples (CRM standards, blanks and core duplicates) were sent to the laboratory for analysis (ALS Perth for all elements and secondary assaying at ALS Langley Canada for any over grade Ag assays). • Entire DD core samples were fine crushed (CRU-42a) to 90% passing 3.15mm. The sample was then rotary split directly from the crusher (SPL-22a) and pulverised to obtain 750g to 85% passing 75 µm (method PUL-25e). These preparation methods are standard and appropriate for the samples. • The 1m half core samples are appropriate to the grain size of the material being sampled. Where intervals of native silver were logged, these were sampled to mineralogical boundaries as low as 0.2m in length.
Quality of assay data and laboratory tests	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.	• Laboratory samples were analysed at ALS laboratories (Perth) for 48 elements, four acid digestion and ICP-MS finish. Samples with above upper detection limit analyses (>100g/t Ag) were then analysed at ALS Perth with Ag-OG62 (four acid, ore grade Ag), ME-OG62 (four acid ore grade elements), Pb-OG62 (ore grade Pb – four acid) and Zn-OG62 (ore grade Zn – four acid). For Ag assays >1,500g/t Ag, samples were sent to ALS Langley (Canada) for analysis by Ag-GRA21 (Ag 30g FA-GRAV finish). For Ag assays >10,000g/t, samples were then further analysed at ALS Langley by Ag-CON01 (Ag concentrate). • Four acid digestion is considered a near total digestion. • The first samples analysed at the start of each hole were a blank then a standard before assaying of core samples, then ending the sample run for the hole with a standard then a blank. • Certified reference material (CRM) standards (OREAS 303b, OREAS-602c, OREAS-608b, OREAS-611b) were inserted in the sampling stream as every 25th sample. Duplicate samples (quarter core) were collected as every 50th sample. Irrespective of where intervals of native silver were sampled in the hole, a duplicate sample was collected which was followed by insertion of a blank.

Criteria	JORC Code explanation	Commentary
		• Acceptable levels of accuracy and precision have been established for all CRM standards and for the majority of the blank material. • Four blanks which had been inserted after core intervals with visible native silver showed some contamination of the blanks from the previous extremely high-grade Ag sample of <1% relative as carry-over from the crusher and pulveriser. The Competent Person (CP) considers the levels of carry-over is acceptable and there was no direct evidence of further contamination after the blank on succeeding samples.
Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	• Significant silver intercepts reported in this announcement were generated by ERM's Principal Structural Geologist and QAQC cross checking and validation completed by the CP. • October 2025 diamond drilling twinned several historical drill holes to verify their reported grades. • Primary data have been entered into spreadsheets on laptops which then have been verified and entered into the database. • No adjustments were made to the assay data.
Location of data points	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• Diamond drill holes are located using a Differential GPS (DGPS) with accuracy to within 20cm for northing and easting. Historical collars have been surveyed by DGPS where collars were found. • 2025 drilling uses a downhole north seeking gyro for surveys that provides continuous readings in and out of the drill hole. The data is uploaded into a database for storage. • A 0.5m DTM is used for topographic control. • Data has been collected in GDA94/MGA Zone 50 and converted to GDA20/MGA Zone 50.
Data spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• Drill holes were spaced 15-25m apart on drill lines that were spaced 10-20m apart. Drill holes were either designed to verify historical drill results and/or test for extensions of mineralisation. • No Mineral Resource or Ore Reserve are reported. • Core samples for laboratory analyses have been taken of the entire drill hole on a 1m sample length but may be reduced to 0.2m or extended to 1.3m where geological or mineralogical parameters required. The exception was for drill holes 25WCDD023 and 25WCDD025 which have been sampled every 5th metre in the upper parts of the drill holes and then every metre through the zone interpreted to potentially contain mineralisation.
Orientation of data in relation to geological structure	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralized structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• Drill holes were oriented with a dip of -60° towards 270°. This hole orientation was designed to intersect the north-south trending, sub-vertical, mineralised structural envelope as close to perpendicular. Geologically described logged intersections do not represent true thickness. • The drill orientation is not expected to have introduced any sampling bias.
Sample security	• The measures taken to ensure sample security.	• Drill core was transported from the drill rig to the storage facility in Karratha by WCE personnel. • Samples have been stored in a secured yard in Karratha under supervision by WCE personnel. • Diamond core samples were collected in individual calico bags and several calico bags were then placed in labelled polyweave bags that were zip locked. Polyweave bags were subsequently

Criteria	JORC Code explanation	Commentary
		loaded into labelled bulka bags that were tied off and secured for transportation. • A chain of control was utilised for tracking of samples from Karratha to the lab in Perth. • Samples were dispatched to the ALS laboratory in Perth via a commercial transport company.
Audits or reviews	• The results of any audits or reviews of sampling techniques and data.	• No audits or reviews of the sampling techniques has been undertaken by West Coast Silver or any independent parties. The data has been audited by ERM's Database Manager before entering into the database. The Database Manager also completed an audit of the QAQC samples.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	• The results reported in this announcement refer to core from holes drilled wholly on M47/342. • The tenement lies within the Ngarluma Native Title claim. • The tenement is in good standing with no known impediments.
Exploration done by other parties	• Acknowledgment and appraisal of exploration by other parties.	• The Elizabeth Hill deposit and adjoining area has been explored for Ni, Cu, PGM, base metals, Li and Ag mineralisation since 1968 when US Steel International Inc explored the area for base metals and nickel. • Massive silver was discovered in ~1994-1995 by Legend mining NL in a percussion hole drilling program. Further drilling followed and in 1997 an exploration shaft and drive was sunk by East Coast Minerals NL. • Underground mining at Elizabeth Hill was conducted in 1999-2000 with additional drilling completed by East Coast Minerals NL until the project was sold to Global Strategic Metals NL in 2012. Alien Metals Ltd purchased the lease M47/342 in early 2020. • Considerable exploration for Ni, Cu, PGM was conducted by Hunter Resources dating back to the 1980s. • Helix Resources acquired the Munni Munni Project in the late 1990's and undertook a number of scoping studies. • In 2002, a SRK Mineral Resource estimate for PGE and Au was published in accordance with the JORC code. • Subsequently, Platina Resources undertook mining studies and two scoping studies for the PGE and Au mineralisation.
Geology	• Deposit type, geological setting and style of mineralisation.	• The Elizabeth Hill silver mineralisation is structurally controlled and is located at the contact of the ultramafic Munni Munni intrusion to the east and Archaean gneisses and granites to the west. This contact is occupied by the north-south trending Munni Munni Fault. Mineralisation has been intersected over a 100m north-south zone along the boundary of the Munni Munni Fault, plunging south along the granite contact. The zone has an east-west width of 15-20m with the high-grade core restricted to around 3m width in the region of the underground workings. The mineralised zone is separated into several pods and occurs within a quartz carbonate chalcedonic silica breccia that contains carbonate and quartz veins. The silver occurs in fine disseminations, needles, veins, nuggets and platelets up to several centimetres in diameter.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:	• Drill information relevant to this release has been provided above in Appendix 1.

Criteria	JORC Code explanation	Commentary
	o easting and northing of the drill hole collar o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar o dip and azimuth of the hole o down hole length and interception depth o hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case	
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated	• 2025 or historical drilling assay data referenced has previously been reported in ASX announcements. • Significant drill core intersections reported in Appendix 2 in this announcement have been calculated using a 25g/t Ag cut-off, are length weighted and up to 2.02m of internal dilution. Some of these significant intervals also include very high grade silver intersections that have been calculated using a 500g/t Ag lower cut-off and are length weighted. • No metal equivalent values are reported.
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').	• Drill hole intersections reported are not true widths due to the sub vertical geometry of the mineralised body and -60° dip of the drill holes.
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• Appropriate maps and figures have been included in this announcement.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results	• All relevant and material exploration data to highlight the areas discussed in this announcement have been reported or referenced. • Drill assay information relevant to this announcement has been provided above in the body of the announcement and in Appendix 3B. Five elements (Ag, Cu, Ni, Pb and Zn) have been reported only in Appendix 3, as they are deemed to be anomalous in mineralised zones. Additional elements analysed are not considered relevant. • Historical drill data and assay results referenced in this announcement have been previously reported in ASX announcements.

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• All relevant and material exploration data for the areas discussed in this announcement have been reported or referenced.
Further work	• The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• Further work will include but not limited to systematic geological mapping, channel and rock chip sampling, soil sampling, pXRF, geophysics, structural interpretation, historical data compilation, and drilling to identify suitable host rock geology and structural architecture for polymetallic mineralisation. • Interpretive diagrams are included in this announcement.
