Catalina Resources

3.64 g/t Au ROCK CHIPS STRENGTHEN KIRKALOCKA GOLD TARGETS

For personal use only

HIGHLIGHTS

- **~1,500 soil assays strengthen priority gold targets across Kirkalocka ahead of November RC drilling.**
- **Avis returns rock chips up to 3.64 g/t Au, with strong gold-in-soil anomalies extending beyond historical workings where rock chips returned up to 9.89 g/t Au (sample 17959)[1].**
- **Coherent gold-in-soil anomalism at Capra coincides with prospective geology, interpreted structures and supporting rock-chip results, defining a priority target largely untested by historical drilling.**
- **Strong gold-in-soil anomalism at Two Mile Bore remains inadequately drill tested, despite nearby historical drilling returning 1m @ 4.66 g/t Au from 34m (CWRC-6807800-002)[2].**
- **Micro-XRF mapping highlights a spatial W-Bi-Mo association within a previously reported sample (SY09) at the Santy tungsten-polymetallic system.**

Catalina Resources Limited (ASX: CTN, "Catalina" or the "Company") is pleased to advise that it has refined priority gold targets at Capra, Avis and Two Mile Bore following interpretation of its ~1,500-sample soil program and recent rock chip results.

The results have strengthened multiple areas for drill testing which is scheduled for November. New rock-chip assays up to 3.64 g/t Au at Avis and coherent gold anomalies at Capra and Two Mile Bore confirm that these prospects remain inadequately tested by historical drilling.

At the Tallering Project, exploration is also progressing at Santy, with new rock-chip assays pending and follow-up analysis showing a W-Bi-Mo spatial association within previously reported 0.31% WO_3 mineralisation[3]. Drilling at Santy is also planned for November, subject to heritage and tenement approvals.

Executive Director, Mr Ross Cotton commented:

"The work at Kirkalocka has done exactly what we wanted it to do - refine our targets and give us clear areas to drill. At Capra, Avis and Two Mile Bore, the combination of soil geochemistry, rock-chip results and geological interpretation has strengthened our confidence in the targets.

The focus now shifts to drilling. Kirkalocka is scheduled for RC drilling in November giving us the opportunity to test the extent and continuity of gold mineralisation across these priority areas.

At Santy, the focus is also on November drilling, with new rock-chip assays pending and further work underway on the tungsten mineralisation."

Gold Targets Refined Ahead of Drilling

Kirkalocka is a key part of Catalina's Mid-West gold strategy, with the Project located immediately adjacent to the Kirkalocka Gold Mine and its 2.0 Mtpa processing plant. Catalina's exploration strategy is focused on building gold scale across its surrounding tenure and establishing a potential pathway to development through nearby infrastructure.

Recent exploration at Kirkalocka has significantly advanced Capra, Avis and Two Mile Bore as priority gold targets for drilling (Figure 1). This in turn highlights the broader regional gold potential, with multiple coherent geochemical anomalies associated with prospective geological and structural corridors providing a pipeline of targets for RC drilling.

With target refinement now complete, Catalina is ready to commence RC drilling in November following completion of heritage clearance.

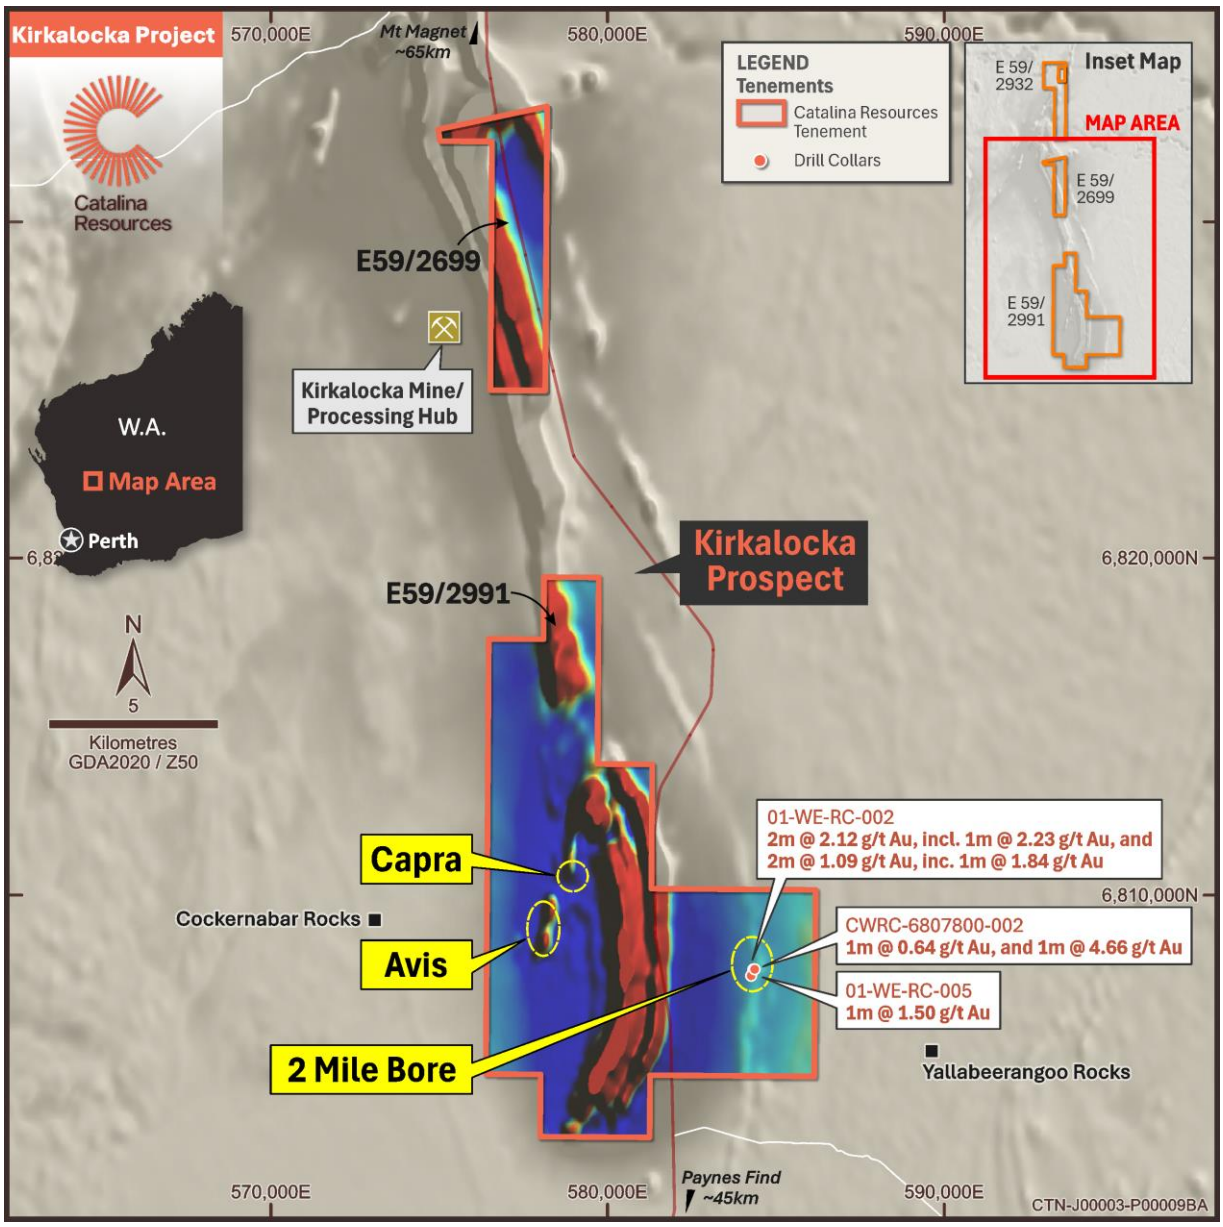

Figure 1: Kirkalocka project[2] with identified high-priority prospects Capra, Avis and Two Mile Bore.

Capra

The main cluster of **anomalous gold-in-soil** results broadly follows the east-west-trending **BIF/chert sequence**, which inflects to a north-northeast orientation in the east where it appears to be fault-offset. The **strongest gold anomalism, including values exceeding 100 ppb Au**, occurs near the southern termination of an outcropping felsic volcanic unit where it is interpreted to be faulted against the BIF/chert sequence.

The distribution of elevated gold values suggests a possible stratigraphic control associated with the BIF/chert units, with much of the exposed sequence displaying elevated gold anomalism. Gold values generally decrease downslope to the south of the main anomaly, suggesting that some dispersion of mineralised regolith may have occurred in this direction.

For personal use only

Further south, lower-order gold anomalism defines northeast and northwest-trending patterns that may reflect conjugate structural controls on mineralisation. These interpreted structures are not readily evident in aerial imagery and will be assessed through further geological and structural interpretation.

Recent rock-chip sampling returned gold values including **0.269 g/t Au (KK005), 0.256 g/t Au (KK006)** and **0.104 g/t Au (KK004)**. Historical rock-chip results[1] include **0.912 g/t Au (CHGR040), 0.195 g/t Au (CHGR042)** and **0.104 g/t Au (CHGR068),** with these results occurring along the **same northeast-trending target corridor defined by the soil anomalism.**

Historical drilling at Capra has been limited. Integration of recent geological mapping, rock-chip sampling and soil geochemistry has further refined the target and identified areas for first-pass RC drill testing. **Six RC holes are planned across two drill fences** oriented approximately perpendicular to the strike of the BIF, **targeting coincident soil and rock-chip gold anomalism** that remains **inadequately tested by historical drilling** (Figure 2).

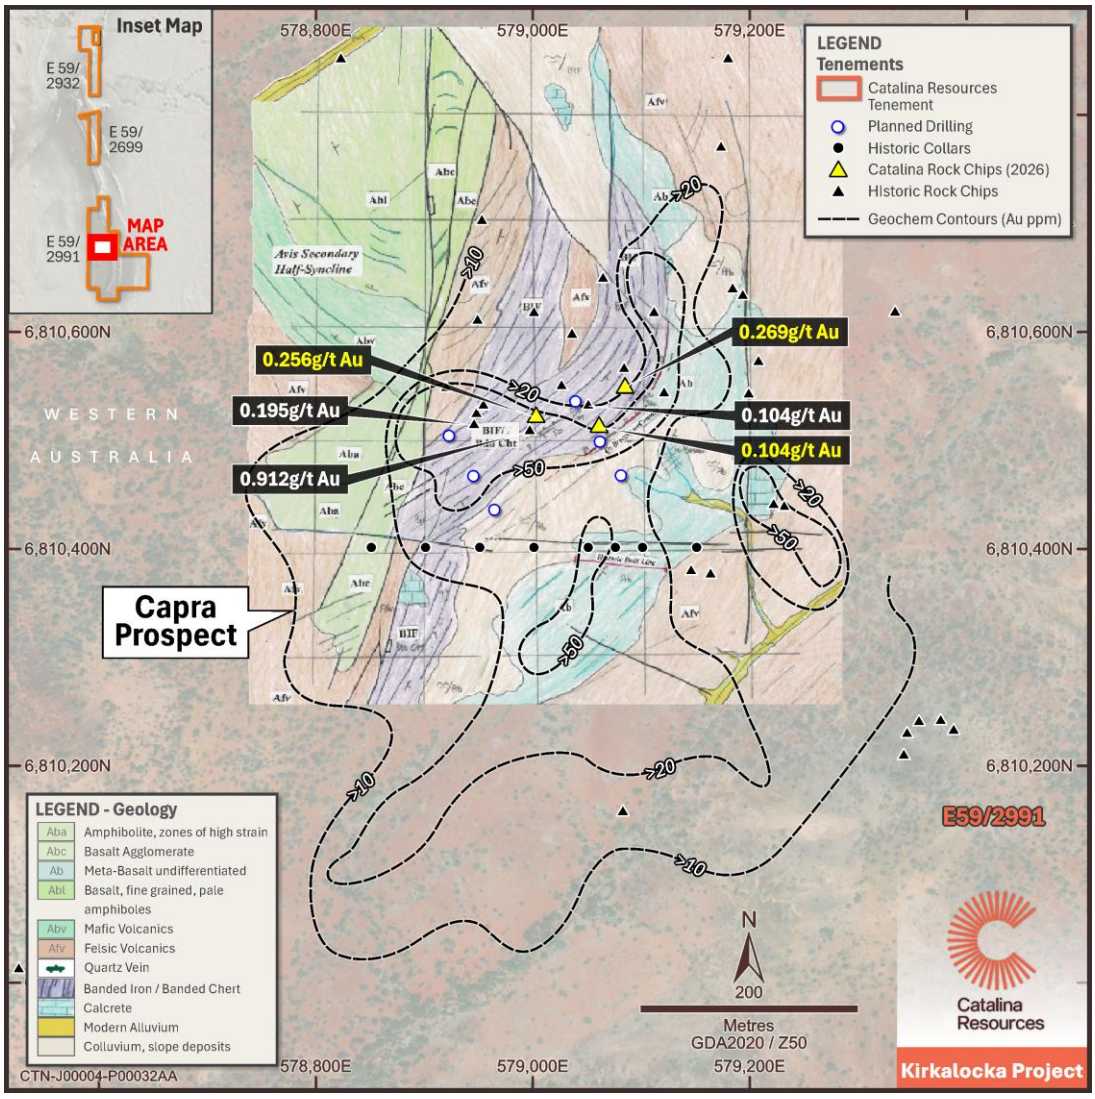

Figure 2: Geological map of Capra illustrating Au soil contours, rock chip results and planned drilling. (Only historical rock-chip samples grading >0.1 g/t Au are labelled)

For personal use only

Avis

Soil geochemistry has defined a **broad northeast-southwest-trending zone of elevated gold values** containing two areas of stronger anomalism. **Four soil samples** returned values **exceeding 200ppb Au.** The orientation of this geochemical trend differs from the predominantly north-south structural grain mapped at Avis and is therefore being assessed in conjunction with the geological and structural interpretation. Importantly, some of the **strongest soil anomalies are spatially separate from the historical workings**, providing additional areas for follow-up.

Recent rock-chip sampling targeting historical workings returned up to **3.64 g/t Au** (KK009), with additional results of **0.361 g/t Au** (KK012), **0.238 g/t Au** (KK007) and **0.077 g/t Au** (KK011). Historical rock-chip sampling[1] in the vicinity of the workings returned up to **9.89 g/t Au**, including **2.59 g/t Au** (17955), **9.89 g/t Au** (17959) and **1.34 g/t Au (CHGR086). Six RC holes** have been designed to **test the geological and structural setting** associated with the historical workings and adjacent gold-in-soil anomalism (Figure 3).

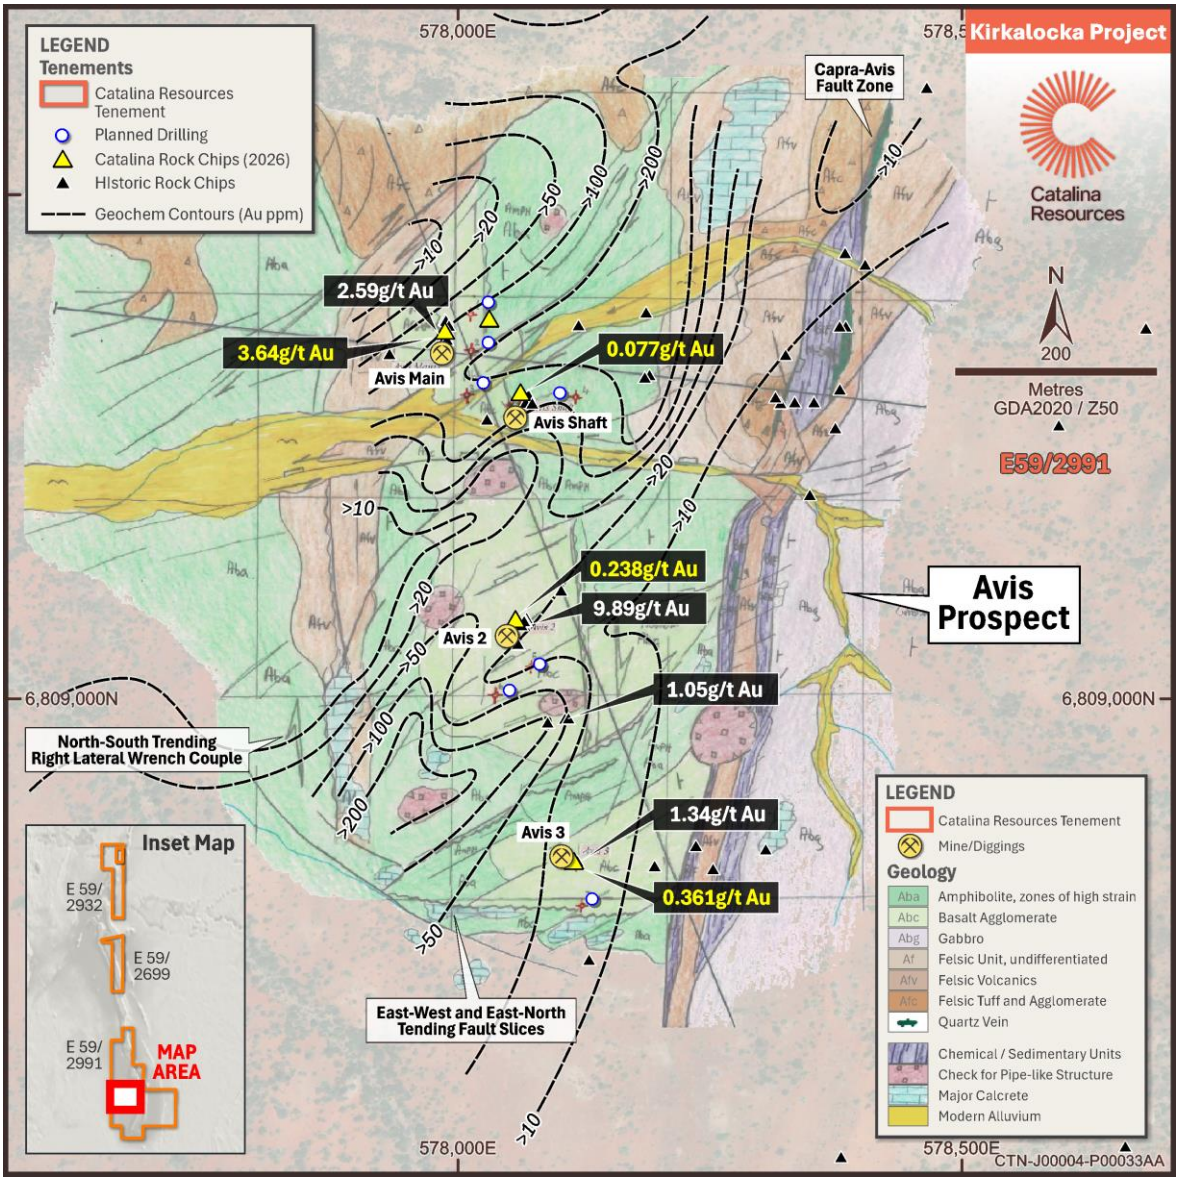

Figure 3: Geological map of Avis illustrating Au soil contours, rock chip results and planned drilling. (Only historical rock-chip samples grading >1 g/t Au are labelled)

For personal use only

Two Mile Bore

Integration of recent and historical soil geochemistry has identified **two principal zones of elevated gold anomalism** south of Two Mile Bore. Earlier soil sampling also defined a north-south zone of anomalism near 584000E that appears to extend northeast and **coincides with a magnetic ridge interpreted to represent the main Cuddingwarra Shear.**

The northern target comprises a **distinct cluster of elevated gold-in-soil results** located on the western flank of the main magnetic ridge. The anomaly extends broadly northeast-southwest and includes a more localised east-west-trending zone of elevated gold values.

Historical drilling within this area returned **gold anomalism in five holes**, including the following intersections from CWRC-6807800-002[2]:

- **1m @ 4.66 g/t Au from 34m**
- **1m @ 0.64 g/t Au from 30m**

Review of historical drilling indicates that **the strongest gold-in-soil anomaly has not been adequately drill tested.** Two east-west-oriented RC drill traverses are therefore being considered to test the northern anomaly and its relationship with the interpreted Cuddingwarra Shear and associated cross-cutting structures (Figure 4).

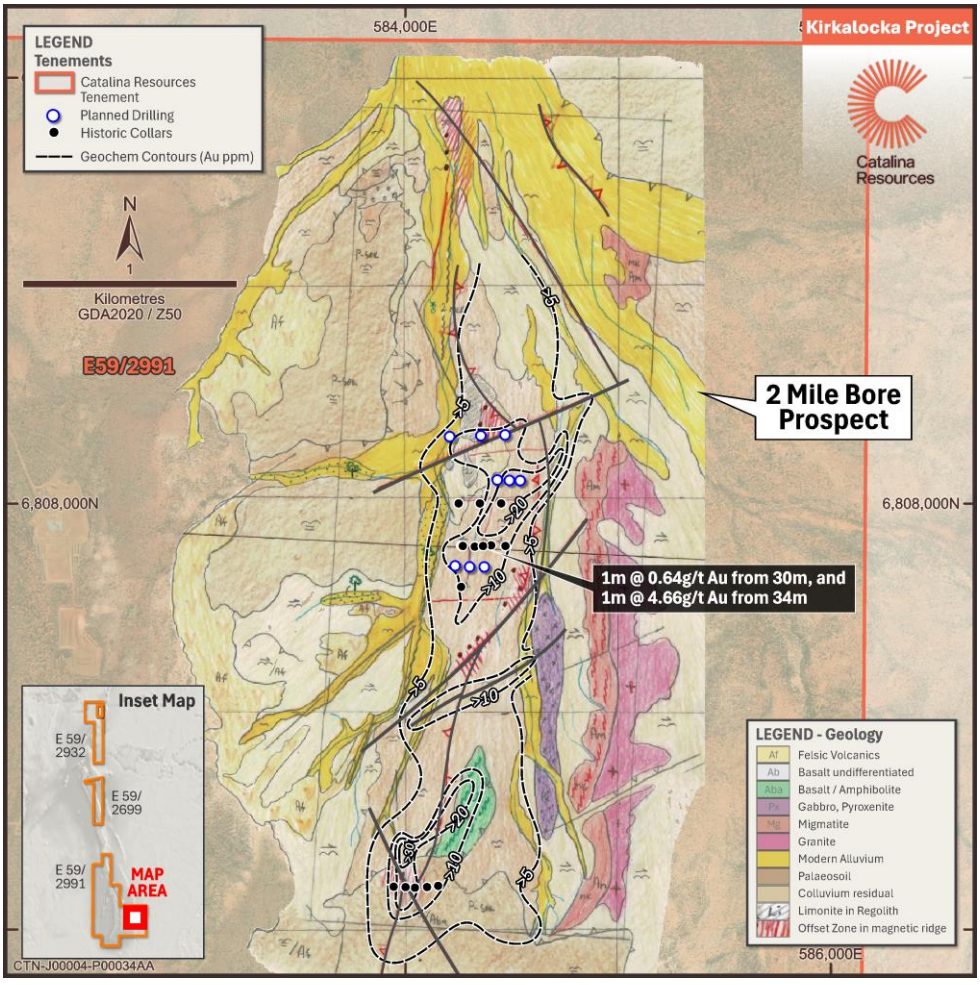

Figure 4: Geological map of Two Mile Bore illustrating Au soil contours, rock chip results and planned drilling.

Tallering Project: Santy – Tungsten Mineralogy Investigation

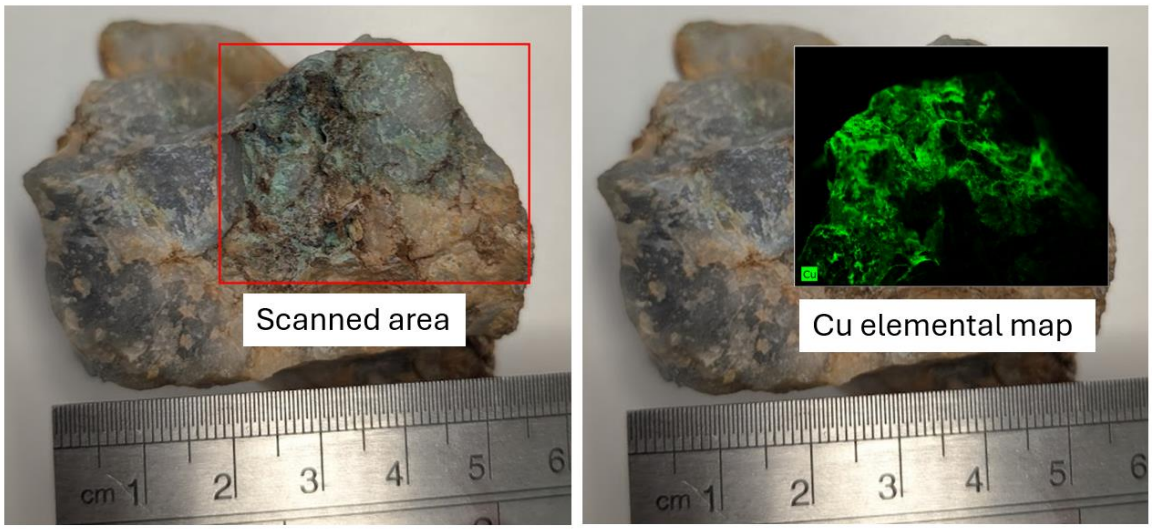

Exploration is also advancing at the Santy prospect within Catalina's Tallering Project, where drilling is planned to commence in November following heritage clearance. Recent fieldwork included additional rock-chip sampling across the prospect, with assay results pending.

In parallel, further technical analysis has been completed on previously reported tungsten-bearing rock-chip sample SY09 (0.31% WO_3) to characterise the distribution of the tungsten mineralisation.

Ultraviolet (UV) short wave light examination was undertaken on previously reported sample SY09 (0.31% WO_3) [3] to test for scheelite ($CaWO_4$), which fluoresces under shortwave UV. A fluorescent response was not observed, suggesting scheelite is unlikely to be the primary tungsten mineral in SY09. Further mineralogical work is planned to identify the host mineral.

Micro-XRF mapping of a selected area of SY09 hand specimen was completed by Portable Spectral Services (PSS), Perth, using a Bruker M4 TORNADO PLUS micro-XRF mapper, to characterise the distribution of W, Bi and Mo and Cu. W, Bi and Mo are spatially in the scanned area, and Cu was not detected in the area of the strongest association (Figures 5-7).

The micro-XRF maps are qualitative, showing relative X-ray counts and not elemental grades or mineral identification. Results are from a single hand specimen and should not be taken as representative of mineralisation at Santy or as an indication of extent of grade continuity. Further analytical details are provided in Appendix B (JORC Table 1).

For personal use only

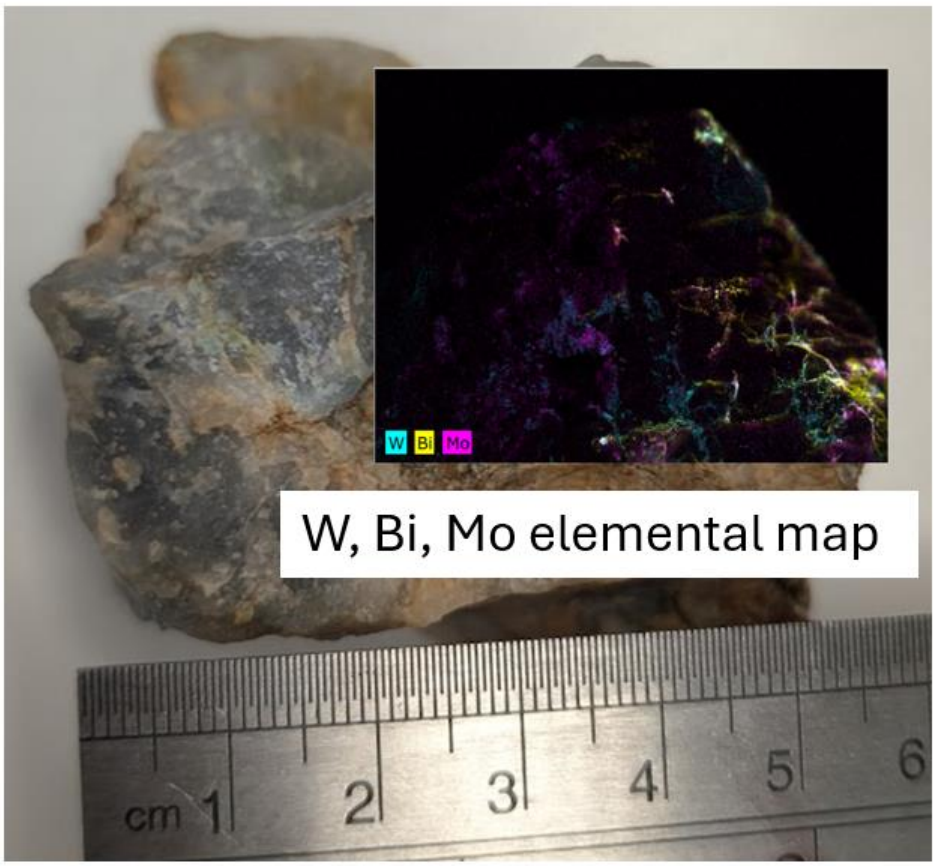

Figure 5-7: Hand specimen (SY09) showing the micro-XRF scanned area (red rectangle) and accompanying W, Bi and Mo and Cu maps. Maps show relative X-ray counts (qualitative).

Next Steps

The focus now shifts to drilling. RC drilling at Kirkalocka is scheduled to commence in November, targeting Capra, Avis and Two Mile Bore following heritage clearance.

At Santy, assays from the recent rock-chip program are pending, with further mineralogical work planned to identify the tungsten host in sample SY09. RC drilling is planned for November to test the IP anomaly.

COMPETENT PERSONS STATEMENT

Reported information in this announcement that relates to exploration activities is based on information compiled by Dr Nishka Piechocka, PhD, Vice President of the Australian Institute of Geoscientists (AIG) and a full-time employee of Catalina Resources Limited. Dr Piechocka has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code). Dr Piechocka consents to the inclusion in the report of the matters based on her information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement and, in the case of estimates of Mineral Resources or Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed.

The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

FORWARD-LOOKING STATEMENTS

This announcement contains forward-looking statements that are subject to a range of risks and uncertainties. These statements relate to the Company's expectations, intentions, or strategies regarding the future. These statements can be identified by the use of words like "anticipate", "believe", "intend", "estimate", "expect", "may", "plan", "project", "will", "should", "seek" and similar words or expressions containing same. These forward-looking statements reflect the Company's views and assumptions with respect to future events as of the date of this release and are subject to a variety of unpredictable risks, uncertainties, and other unknowns. Actual and future results and trends could differ materially from those set forth in such statements due to various factors, many of which are beyond our ability to control or predict. These include, but are not limited to, risks or uncertainties associated with the acquisition and divestment of projects, joint venture and other contractual risks, metal prices, exploration, development and operating risks, competition, production risks, sovereign risks, regulatory risks including environmental regulation and liability and potential title disputes, availability and terms of capital and general economic and business conditions.

Given these uncertainties, no one should place undue reliance on any forward-looking statements attributable to the Company, or any of its affiliates or persons acting on its behalf. Subject to any continuing obligations under applicable law the Company disclaims any obligation or undertaking to disseminate any updates or revisions to any forward-looking statements in this announcement to reflect any change in expectations in relation to any forward-looking statements or any change in events, conditions or circumstances on which any such statement is based.

ABOUT CATALINA RESOURCES LIMITED

Catalina Resources Limited is an Australian diversified mineral exploration and mine development company whose vision is to create shareholder value through the successful exploration of prospective gold, base metal, and speciality metal projects and the development of these projects into production. The mid-west portfolio comprises a growing landholding across a highly prospective mineral province of Western Australia, with projects located in close proximity to the Kirkalocka Gold Mine and other established mining operations and infrastructure. The portfolio hosts multiple gold, copper and critical-mineral opportunities, including the emerging tungsten-polymetallic system at Tallering, providing Catalina with a strong pipeline of exploration targets.

APPENDIX B: JORC CODE, 2012 EDITION - TABLE 1

JORC Code, 2012 Edition - Table 1 report template

Section 1 Sampling Techniques and Data
(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Explanation
Sampling techniques	Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralization that are Material to the Public Report. • In cases where industry standard work has been done this would be relatively simple (eg reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay). In other cases more explanation may be required.	CHGR series rock chips were collected by Golden State Mining (ASX:GSM) in 2024. collected from surface of random sub-crop/outcrop areas and selected following field inspection by qualified field geologists. Samples collected from various interpreted Archaean intrusive lithologies with Lab Sample Preparation Code Prep 02 Sort/Dry/Pulverise <3kg pulverising to 90% passing 75um Average sample weight range 2-3 kg. Rock chip samples collected from approximate 10m2 area of scree/sub-crop/outcrop. Total digest analysis technique is a common and effective analysis technique for this soil sample type in the Eastern Goldfields terrain 15 rock-chip samples were collected by Catalina geologists at Kirkalocka from outcropping or sub cropping rock during surface reconnaissance exploration. Samples comprised individual rock-chip specimens collected from locations considered prospective for gold mineralisation. A total of 1,408 soil samples were collected by OZEX Exploration on systematic grids, predominantly at 100 m × 20 m or 100 m × 40 m spacing. Samples were collected from approximately 20 cm depth and sieved to <2 mm in the field. A total of 39 field duplicate samples were collected as part of the soil sampling program for QA/QC purposes. The sampling methodology is considered appropriate for early-stage geochemical exploration and the identification of geochemical anomalies.
Drilling techniques	• Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger,	No drilling was undertaken. Results reported are from surface soil and rock-chip sampling only.

For personal use only

	Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	
Drill sample recovery	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Not applicable
Logging	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged.	Rock-chip and soil sample locations and relevant geological and field observations were recorded at the time of sampling. Logging was qualitative in nature and appropriate for reconnaissance-stage surface exploration. No drilling was undertaken.
Sub-sampling techniques and sample preparation	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	CHRG series rock chip samples collected from in situ sub-crop/outcrop via geology pick and placed into numbered calico bags. Sample weight 2 - 3 kg. Collected samples bags placed in labelled and numbered plastic and/or polyweave bags for despatch/drop off to assay laboratory. The sample preparation of the samples follows industry best practice, involving oven drying and pulverising to produce a homogenous sub sample for analysis. Representative sampling of material demonstrating uniform lithology and textural/structural characteristics. Internal laboratory standards completed. Sample sizes are appropriate for the grainsize of material being sampled. Soil samples: Loose surface material was removed prior to sampling. Samples were collected at a nominal depth of approximately 20 cm and passed through a 2 mm sieve. Sample locations and field observations were recorded using a proprietary field data application operated by OZEX Exploration. Soil samples were prepared by ALS using PUL-31L, with sample splitting undertaken where required (SPL-21). Pulverisation quality control was undertaken by ALS (PUL-QC).

For personal use only

For personal use only

		Rock chip sampling was selective and reconnaissance in nature and is therefore not necessarily representative of the overall grade or width of the sampled lithology or mineralised zone. Rock chip samples were prepared by ALS, including crushing (CRU-21/CRU-31) and pulverisation of a sample split of up to 250 g to greater than 85% passing 75 µm (PUL-31). Preparation quality control included crushing and pulverisation checks (CRU-QC and PUL-QC).
Quality of assay data and laboratory tests	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	For CHRG series sample All samples were submitted for aqua regia gold assay analysis by Labwest (Perth) using a 25g charge using lab method code WAR25.Selective samples were also submitted for multi-element suite analysis by Labwest (Perth) with up to 62 elements including REEs using lab method MMA-04 following the Sample Preparation (Code Prep02) outlined above. This technique is considered appropriate for analysis.Multi-element assays included the following elements: Ag, As, Ba, Be, Bi, Cd, Ce, Co, Cs, Cu, Dy, Er, Eu, Ga, Gd,Ge, Ho, In,K, La, Li, Lu, Mo, Nb, Nd, Ni, Pb, Pr, Rb, Re, Sb, Sc, Sm, Sn,Sr, Ta, Tb, Th, Tl, Tm, U, W, Y and Yb.No geophysical tools were used in the rock chip analysis. Quality control process and internal laboratory checks demonstrate acceptable levels of accuracy. At the laboratory, regular assay repeats, lab standards, checks and blanks were analysed.Soil samples were analysed for gold using ALS method Au-ST43, comprising aqua regia extraction of a 25 g aliquot with an ICP-MS finish. Multi-element analysis was undertaken using ME-ICP41, comprising aqua regia digestion with an ICP-AES finish. Aqua regia is considered a partial digestion. One sample exceeding the applicable analytical range was subject to over-range gold analysis using Au-AROR43. A total of 39 field duplicate soil samples were collected by OZEX Exploration to assess the repeatability of the soil sampling and analytical process. ALS laboratory QA/QC procedures included internal standards, blanks and preparation quality control. Rock chip samples were prepared using the PUL-31 preparation method. Gold (Au) analysis was undertaken using Au-ICP21, while silver (Ag) and arsenic (As) were analysed using ME-ICP41.

Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	Assay results were received electronically from ALS and reviewed by Catalina personnel prior to incorporation into the exploration database. Sample identification and assay data were checked against field records. No adjustments were made to the assay data. Independent verification or duplicate laboratory analysis of significant results has not been undertaken at this stage. Twinned holes are not applicable as no drilling was undertaken.
Location of data points	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	Sample locations were recorded using handheld GPS in GDA94, MGA Zone 50. Coordinates are reported in metres.
Data spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	Rock-chip sampling was reconnaissance in nature and was not undertaken on a systematic grid. Sample spacing is irregular and appropriate only for identifying areas of anomalous mineralisation. Soil sampling was conducted using a consistent grid typically 100 x 20m or 100 x 40 m spacing.
Orientation of data in relation to geological structure	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	Rock-chip sampling was reconnaissance in nature and targeted prospective lithologies, mineralised veins and areas associated with historical workings. Soil sampling was undertaken on systematic grids over selected target areas. At the current stage of exploration, the geometry and orientation of mineralisation are not sufficiently constrained to determine whether the sampling orientation introduces bias.
Sample security	• The measures taken to ensure sample security.	CHRG series samples were bagged up in labelled and numbered polyweave bags and delivered by Company authorised personnel or reputable freight contractor to the laboratory in Perth. Samples were then sorted and checked for inconsistencies against lodged Submission sheet by laboratory staff.

For personal use only

		Following analysis, the sample pulps and residues are retained by the laboratory in a secure storage yard. All other rock chip samples were delivered to ALS laboratory in Perth by Catalina Geologists. Soil samples were couriered to Perth ALS laboratory via a consignment and tracking number.
Audits or reviews	• The results of any audits or reviews of sampling techniques and data.	No audits were completed.

Section 2 Reporting of Exploration Results
(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Explanation
Mineral tenement and land tenure status	• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The Company currently holds the relevant Kirkalocka project tenure for tenements E 59/2932, E 59/2699, E 59/2991, and is not aware of any material environmental, heritage, native title or other impediments to undertaking exploration activities within the project area. The Santy project is located within Exploration Licence Application E59/3068, which is currently pending grant. The application remains subject to completion of relevant Native Title processes and statutory approvals. The Company is not aware of environmental, heritage, or other material impediments that would prevent grant,
Exploration done by other parties	• Acknowledgment and appraisal of exploration by other parties.	Historical exploration within the Kirkalocka Project area has been undertaken by several previous explorers, including Gold State mining Ltd, Equigold NL, Mount Magnet South Limited and Minjar Gold Pty Ltd. Exploration activities completed across the project area include geological mapping, regolith interpretation, soil and lag geochemical sampling, aircore drilling, reverse circulation (RC) drilling and geological logging. Historical exploration programmes were primarily designed to assess the gold potential of prospective greenstone belt stratigraphy, including banded iron formation (BIF), mafic volcanic and ultramafic units concealed beneath varying depths of transported cover. The historical datasets reviewed by the Company comprise drill collar records, geological logging, downhole geochemistry and surface geochemical sampling data. These datasets provide valuable

For personal use only

For personal use only

		geological and geochemical information that supports ongoing target generation, geological interpretation and prioritisation of future exploration activities. The Company has compiled and reviewed publicly available historical exploration data from WAMEX reports, historical databases and associated technical documentation. Historical exploration results referred to in this announcement have not been independently verified by the Company and should be regarded as historical in nature pending further validation work. Historical exploration within the Tallering Project area was undertaken by several parties including CRA Exploration Pty Ltd, Preussag Australia Pty Ltd, Giralia Resources NL, Atlas Iron Limited, Galahad Resources Limited and BPM Minerals Ltd. Activities included geological mapping, rock-chip and soil geochemical sampling, airborne and ground geophysical surveys, and AC, RC and RAB drilling targeting gold, base metal and tungsten mineralisation. Historical exploration identified multiple gold, silver, copper and tungsten anomalies. RC drilling was completed prior to the Induced Polarity survey however results identified anomalous gold and copper, silver mineralisation at the Santy prospect.
Geology	• Deposit type, geological setting and style of mineralization.	The Kirkalocka project lies on the eastern margin of the Murchison granite-greenstone province and specifically at the southern end of the Wydgee - Meekatharra Greenstone Belt. In the vicinity of the project, the greenstone belt varies in thickness from 2.0 to 5.5 kilometres in width. The belt is elongate and trends in a north south direction. Lithologies of the Luke Creek Group which include the Windanning, Gabanintha, Golconda and Murrouli Basalt are present. These formations include felsic and mafic volcanics and banded iron lithologies. Felsic intrusives are also observed close to the belt boundaries. The orientation of these rocks is roughly parallel to the marginal contacts. In this region, the belt has undergone contact metamorphism to greenschist-amphibolite facies. The Mt. Magnet Shear runs parallel to the eastern margin along the length of the belt. The geological interpretation presented is based on historical exploration information and has not been independently validated by Catalina Resources.

For personal use only

		• The Tallering Project is located on the north-eastern end of the Archaean Tallering Greenstone Belt along the western margin of the Murchison Domain within the Yilgarn Craton. The belt is dominated by the Gabanintha Formation, comprising tholeiitic and high-magnesium basalts, felsic volcanic and volcaniclastic rocks and sediments, and the overlying Windanning Formation, which contains jaspilite, banded iron formation, cherts and felsic volcanic units. The sequence has been intruded by post-tectonic granites and cross-cut by Proterozoic mafic dykes. Historical exploration identified structurally controlled gold and polymetallic mineralisation associated with favourable lithological contacts, structural corridors and sulphide-bearing systems. Galahad drilling tested quartz-sulphide veins, associated shears and silicified felsic volcanic rocks comprising felsic to intermediate tuffs, dacites and rhyolites. Mineralisation is associated with pyrite-bearing quartz veins, silica-sericite alteration and structural deformation. A dolerite/gabbro intrusion crosscuts the prospect area.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of easting and northing, elevation or RL, dip and azimuth, down hole length and interception depth, and hole length for all Material drill holes. • If exclusion is justified because the information is not Material and does not detract from understanding, the Competent Person should clearly explain why.	Historical drilling results referred to in this announcement have been previously reported by the Company and are not new Exploration Results. The Company confirms that it is not aware of any new information or data that materially affects the information contained in the original announcement.
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cutoff grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used should be stated. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	Not applicable. Not cut-off all results published.
Relationship between mineralization	• These relationships are particularly important in the reporting of Exploration Results.	No drilling was undertaken. Results reported are from surface rock-chip sampling and soil

widths and intercept lengths	• If the geometry of the mineralization with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect.	sampling at Kirkalocka and UV light imagery at Santy.
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Appropriate maps displaying all the data points and anomalous values are provided in this announcement.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	The Company has reported the most significant results identified from rock chip and soil sampling. Complete assay results are provided in the accompanying tables. The Company considers this reporting to be balanced and representative of the historical exploration data available for review.
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including geological observations; geophysical and geochemical survey results; bulk samples; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; and potential deleterious or contaminating substances.	Micro-XRF analysis on sample SY09 (Tallering Project) was undertaken by Portable Spectral Services, Perth (PSS), using a Bruker M4 TORNADO PLUS micro-XRF mapper with data interpretation using Advanced Mineral Identification and Characterisation System (AMICS) software in order to map mineralogy. X-ray acquisition was made using the instruments Rh tube set to 50 kV at 600 µA, a dual 60 mm^2 XFlash® detector and 2 mbar sample chamber pressure. Initial sample scans were made using a 100 µm pixel with 30ms/pixel dwell time. X-ray analysis is not just a surface technique and has a depth component that is dependent on the elemental composition of the material being analysed, which controls incident X-ray penetration into the sample and the escape and detection of fluorescent X-rays. Therefore, raw elemental responses can reflect sub-surface fluorescent responses up to 5mm. The dataset has a lower size limit of 100 µm that reflects the size of the mineral map pixels, smaller grains cannot be accurately identified using this technique – as such, the µXRF technique in this context is being used to better understand the deportment of larger grains and their likely size range. There are some limits to the geochemistry identified as a result of elements detected under X-ray fluorescence and scan resolution - with the range of confidence being from Na to U. Micro-XRF is a non-destructive, complimentary technique to other techniques such as scanning electron microscopy

For personal use only

Further work	• The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale stepout drilling).	Further work includes RC drilling at priority targets at Kirkalocka.

For personal use only
