COMPANY OVERVIEW

For personal use only

The information contained in this presentation has been prepared by White Cliff Minerals Limited (the Company).

To the maximum extent permitted by law, the Company and its related bodies corporate, affiliates and each of their respective directors, officers, partners, employees, advisers and agents and any other person involved in the preparation of the presentation disclaim all liability and responsibility (including without limitation any liability arising from fault or negligence) for any direct or indirect loss or damage which may arise or be suffered through use or reliance on anything contained in, or omitted from, the presentation.

No representation or warranty, express or implied, is given as to the fairness, accuracy, completeness, likelihood of achievement or reasonableness of any assumptions, forecasts, prospective statements or returns contained in the presentation. Such assumptions, forecasts, prospective statements or returns are by their nature subject to significant uncertainties and contingencies, have been based on current expectations about future events and are subject to risks, uncertainties and assumptions that could cause actual results to differ materially from the expectations described. The Company has no responsibility or obligation to inform you of any matter arising or coming to its notice, after the date of this presentation document, which may affect any matter referred to in the presentation.

All statements other than statements of historical fact included in this presentation including, without limitation, statements regarding future plans and objectives of White Cliff, are forward-looking statements. Forward-looking statements can be identified by words such as "anticipate", "believe", "could", "estimate", "expect", "future", "intend", "may", "opportunity", "plan", "potential", "project", "seek", "will" and other similar words that involve risks and uncertainties. These statements are based on an assessment of present economic and operating conditions, and on a number of assumptions regarding future events and actions that are expected to take place. Such forward-looking statements are not guarantees of future performance and involve known and unknown risks, uncertainties, assumptions and other important factors, many of which are beyond the control of the Company, its directors and the management of White Cliff that could cause the Company's actual results to differ materially from the results expressed or anticipated in these statements.

White Cliff cannot and does not give any assurance that the results, performance or achievements expressed or implied by the forward-looking statements contained in this presentation will actually occur and investors are cautioned not to place any reliance on these forward-looking statements. The Company does not undertake to update or revise forward-looking statements, or to publish prospective financial information in the future, regardless of whether new information, future events or any other factors affect the information contained in this presentation, except where required by applicable law and stock exchange listing requirements.

This presentation includes photographs of samples. Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.

You must not rely on the presentation provided but make your own independent assessment of the presentation and seek and rely upon your own independent taxation, legal, financial or other professional advice in relation to the presentation and any action taken on the basis of the presentation. All information in this presentation is current as at 11th October 2026.

INVESTOR HIGHLIGHTS

DEFINING A LARGE-SCALE COPPER OPPORTUNITY IN ONE OF THE WORLD'S LEADING MINING JURISDICTIONS

STRATEGIC BACKING	Hancock Prospecting has agreed to invest **~A$8.77m** for a **~13.5%** strategic stake(1). Proceeds will be used to accelerate drilling across the Rae district that continues to grow in scale & significance.
DISTRICT SCALE POSITION	First mover advantage, securing the largest land position in a rapidly emerging high-grade copper district, with near-surface mineralisation and district-scale upside. Danvers is getting bigger - first drilling at Bornite Hills(2) has delivered a new discovery 32km from Danvers, while Hulk has confirmed copper across a >10km² sediment footprint
HIGH GRADE COPPER AT DANVERS	Highlights include **175m @ 2.5% Cu**, **90m @ 4.0% Cu** and **105m @ 2.25% Cu** from surface at Danvers 1, **30.5m @ 2.5% Cu** at Danvers 2 and **23m @ 6.18% Cu** at Danvers 3(3). Diamond drilling has confirmed high-grade mineralisation to more than 280m vertical depth(4)
SEDIMENT HOSTED UPSIDE	Copper confirmed at the base of the Rae Group over a known footprint of **>10km²**. High-definition aerial Sander Geophysics survey underway across **>70km** of priority structures to define 2027 drill targets(2)
TIER 1 JURISDICTION	Canada has committed over **C$40 billion** to Arctic and critical minerals infrastructure(5), including the nearby Grays Bay Road and Port, a 230km all-season road and deepwater export terminal advancing through Rae's Kitikmeot region(6)
ALIGNED BOARD & MANAGEMENT	A board combining listed company leadership, exploration success, project development, legal and capital markets experience. Directors and management have invested **>A$4m** in shares and options on market and in placements over the past 18 months

RAE COPPER-SILVER PROJECT

PROJECT OVERVIEW & SCALE

LOCATION

Nunavut, Canada

Cu Ag

Ideally located a short flight from the regional mining hub of Yellowknife & 75km from the coastal port town of Kugluktuk

NUNAVUT CRITICAL MINERALS RUSH

THE RUSH IS ON

- Critical minerals exploration is surging across the Western Kitikmeot Region, with renewed investment in copper, nickel, uranium and other critical mineral projects as Canada turns its attention north
- Proposed infrastructure is set to connect Nunavut to the rest of North America and global shipping lanes for the first time
- Grays Bay Port proposed as Canada's first deepwater port on the western Arctic coast(1)
- Arctic Economic & Security Corridor - proposed ~400km all-season road linking Yellowknife and Grays Bay to Canada's national highway network(2)

COMMUNITY ENGAGEMENT

A Supportive Landscape

Exploration operators in Nunavut benefit from the Inuit Land Claims Agreement, which provides a clear legal and governance framework that protects Inuit rights while supporting responsible resource development

ACCESS & INFRASTRUCTURE

LOCATED PROXIMAL TO PORT AND INFRASTRUCTURE

For personal use only

Site Airstrip · Year-round all-weather runway directly to site

Kugluktuk Port · 75km away. Deep-water port access, supply hub

Yellowknife Hub · ~90 min flight. Established Tier 1 mining centre

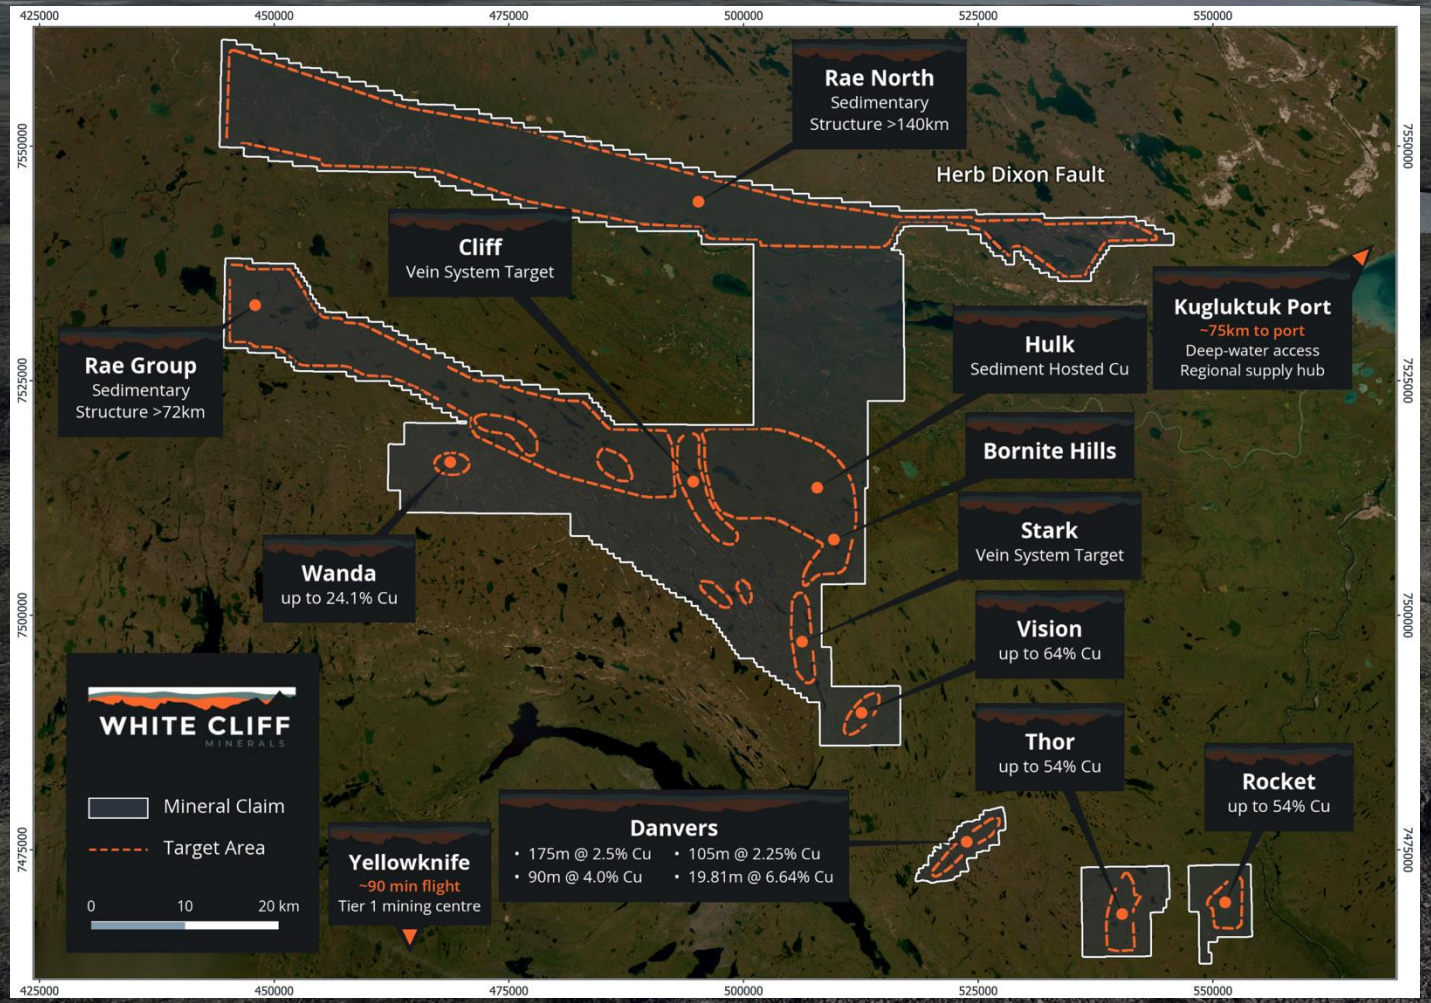

THE RAE PROJECT | LOGISTICS & INFRASTRUCTURE

- Strategically located 75km from Kugluktuk, providing local logistics support and future barge access to the proposed deep-water port at Grays Bay
- Year-round air access to site via all-weather runway
- Yellowknife is a 90-minute flight away - an established mining hub of >23,000 people, anchoring the region's skilled workforce and logistics base
- Sits within a proven mining district, alongside Agnico Eagle's Hope Bay and B2Gold's Goose gold mines
- With decades of aviation, workforce, and logistics infrastructure developed through the region's diamond mining operations at Ekati and Diavik, region district has a proven operational track record and deep infrastructure capacity.
- Backed by Canadian government investment in northern infrastructure, including roads, services and port development(1)
- Region benefiting from Canada's $1.5B Critical Minerals Infrastructure Fund (CMIF)(2)
- $50M in federal funding approved (May 2026) for the Grays Bay deepwater port and 400km transport corridor - The corridor is designed to unlock access to strategic zinc and copper deposits, feeding materials into national supply chains

RAE PROJECT AREA

DISTRICT-SCALE COPPER SYSTEM CONFIRMED | 2026 DRILLING EXPANDS SCALE SIGNIFICANTLY

Diamond Drilling @ the Rae Project

Example of chalcopyrite-bornite hosting quartz-carbonate veining in STK25001 between 181.30 and 181.52m downhole. Core diameter is NQ2.

(1) Assays at Vision, Thor, Rocket and Wanda are reported in ASX Announcement Dated: 4 October 2024 "Large Scale Copper Discovery Confirmed at Rae Project"; and 14 October 2024 "High-Grade Copper Results Continue at Rae"

For personal use only

RAE PROJECT STRATEGY

THREE-PRONGED STRATEGY UNDERWAY AT RAE

For personal use only

1. Danvers High-Grade Vein Hosted Copper Deposit

ADVANCING DANVERS TO RESOURCE DEFINITION

- Regional drilling tested 11.8km of strike along the Teshierpi Fault Zone and extensions to Danvers 1
- Results include 175m @ 2.5% Cu, 90m @ 4% Cu, 105m @ 2.25% Cu and 19.81m @ 6.64% Cu, with the first diamond hole returning 50.9m @ 2.81% Cu(1)
- Up to 95.4% Cu recoveries with a simple conventional flotation flowsheet(2)

NEXT STEPS

- Diamond drilling stepping out from high-grade zones defined in the Phase 1 RC campaign
- Early works toward a JORC Exploration Target & Maiden Resource Estimate for Danvers 1 during 2027

2. Sedimentary Copper

TARGETING A PROSPECTIVE REGIONAL COPPER HORIZON

- Copper confirmed at the base of the Rae Group over a known footprint of >10km², with significant intercepts in 5 of 8 holes drilled in 2026(3)
- 2025 intercepts include 25m @ 0.6% Cu, plus 3.5m @ 7.2% Cu in the basement below(5)
- Growing technical understanding of the area is sharpening the targeting approach

NEXT STEPS

- Sander Geophysics ultra high definition mag, gravity & radiometric survey over >70km of contact to rank 2027 drill targets(3)
- Coincident electrical & geochemical anomaly east of Stark 1 remains a priority drill target

3. Regional Prospects: Bornite Hills, Thor & Rocket

PROVING UP THE GREATER RAE AREA

- First drilling at Bornite Hills delivered a new discovery 32km from Danvers, with >32m of bornite dominant mineralisation logged (visual, assays pending)(3)
- Thor and Rocket host high-grade surface copper, with rock chips up to 54.02% Cu and 54.12% Cu(4)

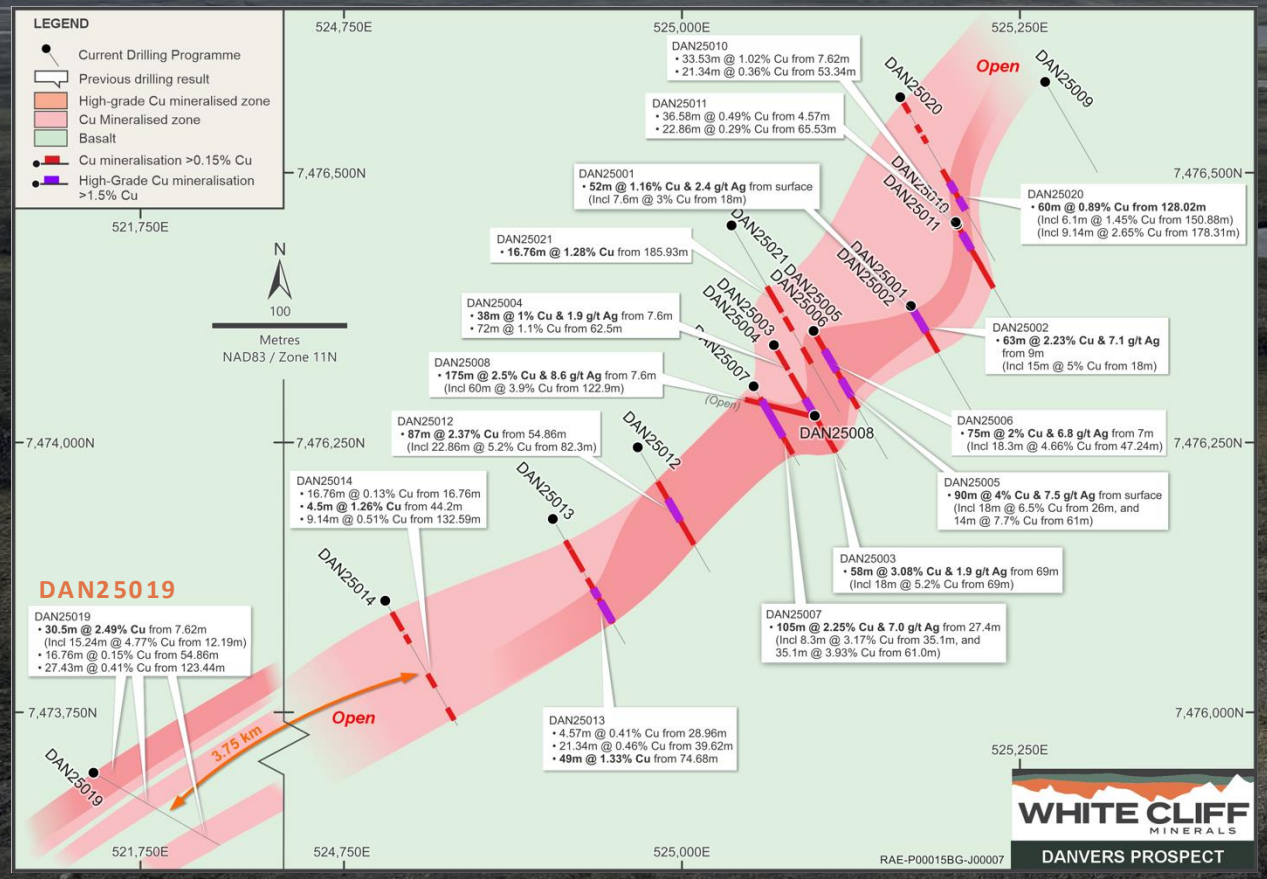

NEXT STEPS

- Bornite Hills assays expected October 2026(3)
- Till sampling underway at Thor & Rocket prospects - both of which are covered by the Sander survey(3)

(1) See ASX announcements dated 6 May 2025 "175 m @ 2.5% Copper hole ends in 4.46% Cu"; 21 May 2025 "Rae delivers further CU results with 90m @ 4% from Surface"; 5 June 2025 "105 mtrs @ 2.25% Cu from 27.43m at Danvers"; 10 June 2026 "Exceptional Grade Copper Discovery at Danvers"; 5 August 2026 "First Diamond Drill Hole Assays 50.9m @ 2.81% Cu"
(2) See ASX announcement dated 8 April 2026 "Excellent Met Results at Rae Deliver Plus 95% Cu Recovery" (3) See ASX announcement dated 21 September 2026 "Bornite Hills Delivers Significant Copper Discovery at Rae"
(4) See ASX announcements dated 4 October 2024 "Large Scale Copper Discovery Confirmed at Rae Project"; 14 October 2024 "High-Grade Copper Results Continue at Rae". Rock chips are selective and may not be representative (5) See ASX announcements dated 28 October 2025 "Drilling at Stark Identifies Sedimentary Copper Discovery"; 26 November 2025 "Mineralised structure at Stark expands with assay results"

DANVERS | 2025 DRILLING RESULTS

HIGH-GRADE COPPER SYSTEM

- 3,131 line-km of high-resolution Aerial Geophysics undertaken
- Independent interpretation of EM, IP and magnetics outlines structurally controlled targets with strong conductivity responses
- Targets correlate with recent drilling success and surface assays

DANVERS | TIER 1 SCALE

2026 DRILLING ADVANCES DISTRICT-SCALE COPPER TARGET | >95% DRILLING STRIKE RATE FOR CU MINERALISATION

PHASE 1 REGIONAL DRILL TESTING COMPLETE(1)

>11.8km	>11.5km	3,131km
Phase 1 strike tested	Assay confirmed Cu mineralised footprint	Aerial geophysics, EM, IP & mag

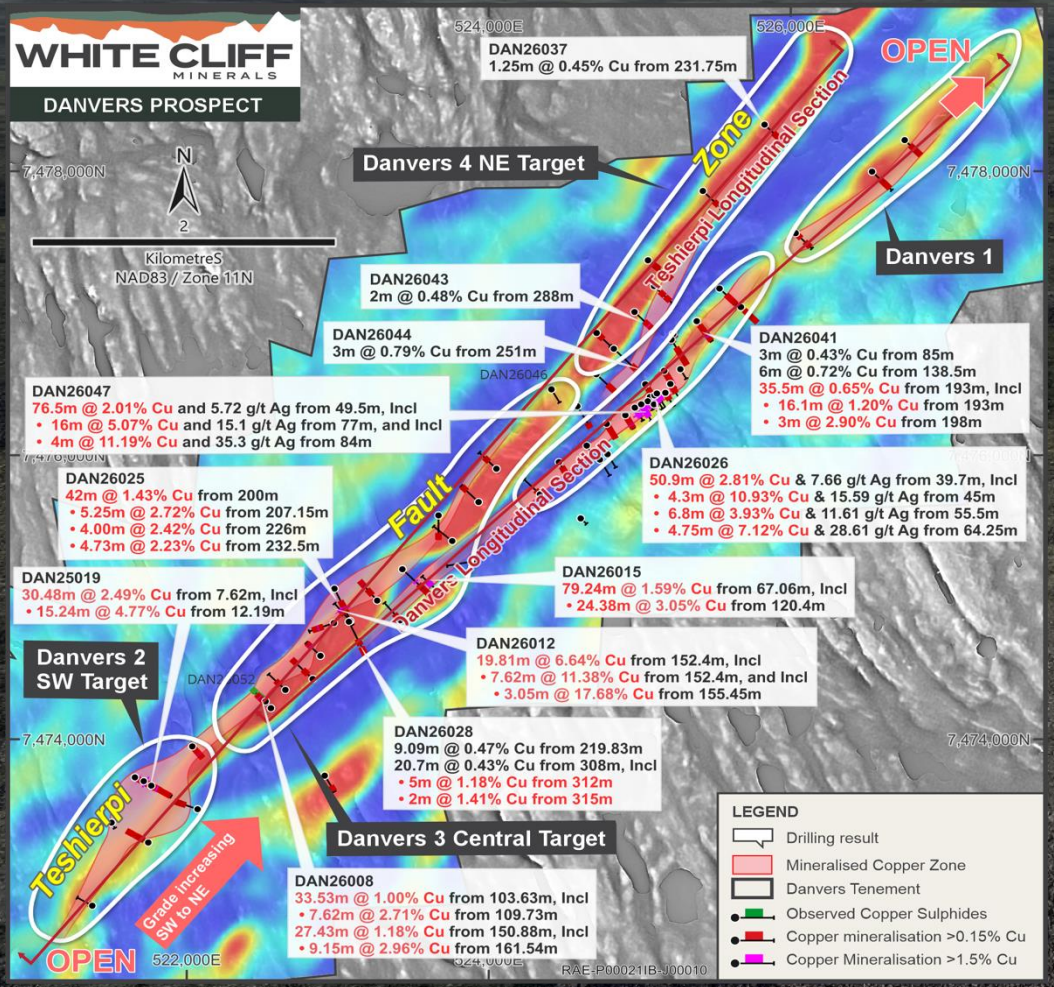

- Regional drilling complete, confirming continuity of the Teshierpi Fault Zone and identifying new discovery zones at Danvers 2, 3 and 4, plus a new area at DAN26015 beyond the main corridor
- Danvers 3 alone is comparable to the initial Danvers 1 discovery area, with fewer than 5 holes drilled
- Phase 2 diamond drilling is underway, infilling the regional program, targeting high grade zones and delineating mineralisation to inform JORC Exploration Targets and MREs

(1) See ASX announcement dated 13 August 2026 "Assays confirm high-grade copper continuity to >280m vertical depth"

For personal use only

DANVERS | SCALE REDEFINED

DISTRICT-SCALE COPPER SYSTEM CONFIRMED | HIGH-GRADE ASSAYS VALIDATE SCALE ACROSS DANVERS

HIGHLIGHTS FROM ASSAYS[1]

- Regional scale confirmed
- Phase 1 regional drilling complete a total of 44 holes (24 RC, 20 diamond) across 11.8km of strike
- Phase 2 diamond drilling underway, mineralisation confirmed to over 280m vertical depth
- New discovery zones identified at Danvers 2, Danvers 3 and Danvers 4, extending the system beyond Danvers 1

OUTSTANDING RC RESULTS

VISION

PRIMARY STRUCTURAL CORRIDOR

64.02% Cu

& 152g/t Ag · peak rock chip

FOOTPRINT

+10km NE/SW corridor along the Herb Dixon Fault

2026 STATUS

Sits on the same Herb Dixon Fault Zone, the area's largest fault, interpreted to be the primary conduit of hydrothermal copper fluids that hosts the new Bornite Hills discovery

● SAMPLED ○ GEOPHYSICS ○ DRILLED

Rock chip and trench samples are selective by nature and may not be representative of mineralisation across each prospect. The Bornite Hills trench result is historic. Bornite Hills drill intervals are visual observations of downhole length, true width unknown, assays pending; see the visual estimates statement on page 1. Geophysics and drilling markers show work completed or underway. See ASX announcements dated 4 October 2024 "Large Scale Copper Discovery Confirmed at Rae Project"; 14 October 2024 "High-Grade Copper Results Continue at Rae"; 3 November 2025 "Strategic acquisition of Bornite Lake prospect at Rae"; 21 September 2026 "Bornite Hills Delivers Significant Copper Discovery at Rae"

SEDIMENT HOSTED COPPER

ONE OF THE LARGEST EMERGING SEDIMENTARY COPPER TARGETS WORLDWIDE

For personal use only

GLOBAL GEOLOGICAL ANALOGUES

The Rae project area is similar in age, geology and formation to both the Central African Copperbelt and the European Permian Kupferschiefer, host to some of the largest stratiform copper deposits in the world

>75km
of horizon controlled

The prospective upper Rae Group sedimentary horizon is controlled by White Cliff over >75km

2nd
prospective horizon

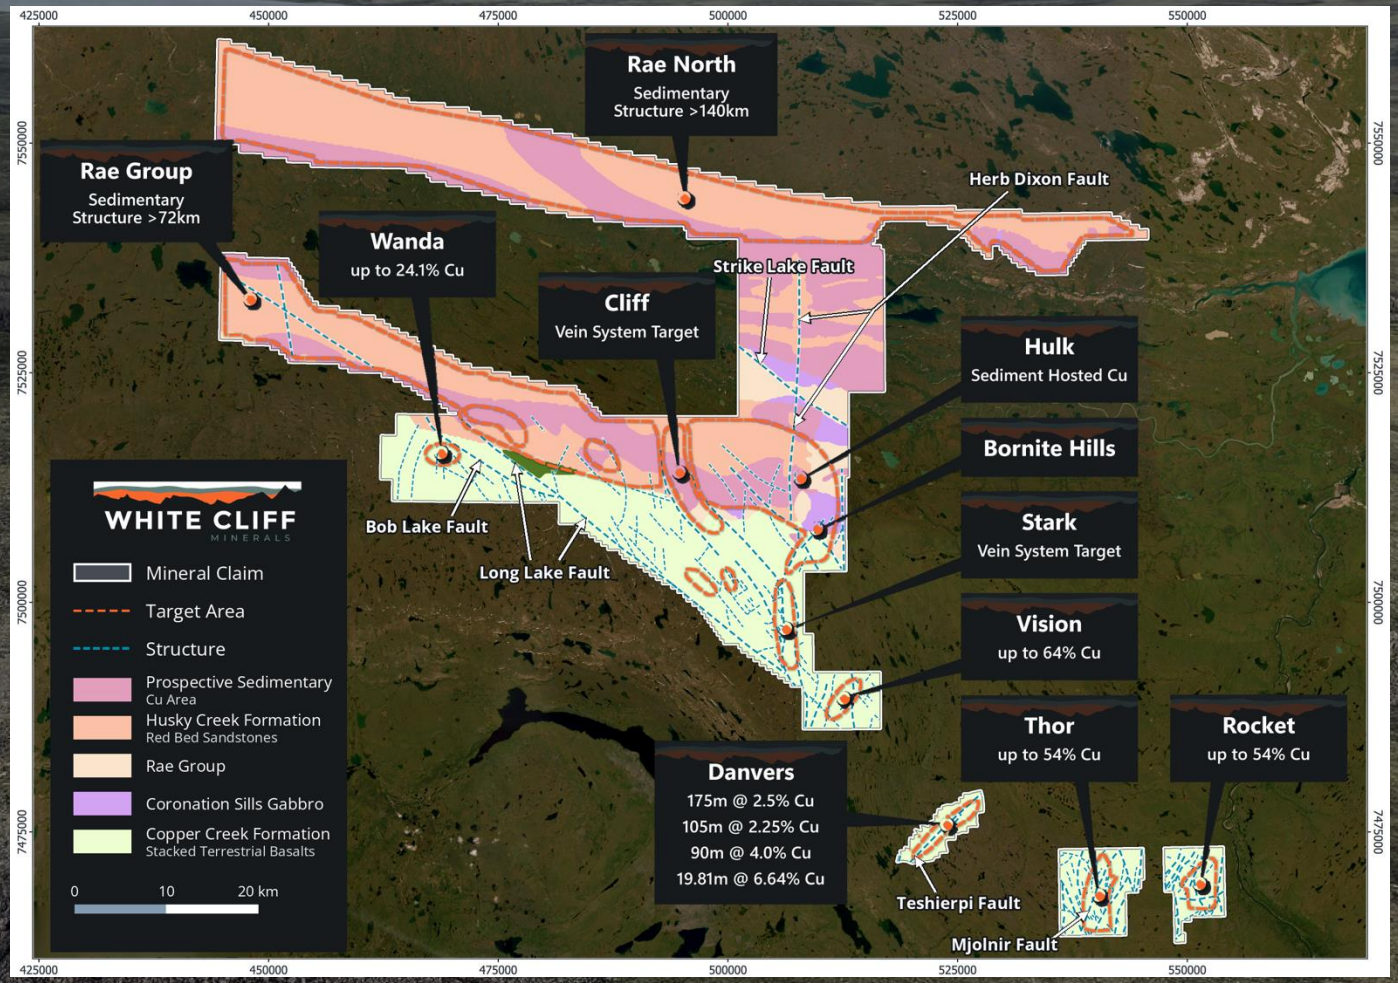

A further sedimentary horizon with proven historic copper showings and sediment copper anomalies, akin to the Mt Gunson copper district in Australia

7.2% Cu
over 3.5m in the basement

Copper-bearing structures confirmed beneath the Rae Group in STK25001, including veining that assayed 14.95% Cu

2027
target ranking

New survey data to be integrated with 2024 MobileMT and 2025 and 2026 drilling to rank targets along the largely untested contact

Rae District Sedimentary Targets

See ASX announcements dated 21 September 2026 "Bornite Hills Delivers Significant Copper Discovery at Rae" (Table 01 for all 2026 sedimentary intercepts); 17 December 2025 "1.75km of Copper Mineralisation identified in Sediments"; 26 November 2025 "Mineralised structure at Stark expands with assay results"; 28 October 2025 "Drilling at Stark Identifies Sedimentary Copper Discovery"

HULK | SEDIMENT HOSTED COPPER

A COPPER HORIZON CONFIRMED AT HULK | NOW TARGETING THE TRAPS

For personal use only

01 COPPER HORIZON CONFIRMED

>10km²

known footprint

Copper confirmed at the base of the Rae Group over >4.3km east-west and >2.1km north-south. Significant intercepts in 5 of 8 holes drilled in 2026

02 LARGELY UNTESTED

2.6km

widest drill spacing

Mineralisation open east and west, with substantial areas untested between intercepts and along the wider contact

03 TARGETING THE TRAPS

>70km

of contact in survey

Sander Geophysics ultra high definition mag, gravity and radiometric survey commissioned to map the structures and traps that may localise mineralising fluids, and rank targets for 2027 drilling

HULK BASIN SCALE

>12km

Hulk basin length

Sedimentary basin traced over >12km, with >5.5km of conductivity yet to be drill tested

Chalcopyrite-bornite-quartz-carbonate veining below the base of the sedimentary sequence in STK25001 at 291.4m, which assayed 14.95% Cu & 0.51g/t Au. Core diameter is NQ2

See ASX announcements dated 21 September 2026 "Bornite Hills Delivers Significant Copper Discovery at Rae" (Table 01 for all 2026 sedimentary intercepts); 29 June 2026 "Diamond Drilling Extends Hulk Sediment-Hosted Copper System"; 17 December 2025 "1.75km of Copper Mineralisation identified in Sediments"; 26 November 2025 "Mineralised structure at Stark expands with assay results"; 28 October 2025 "Drilling at Stark Identifies Sedimentary Copper Discovery"

UPCOMING ACTIVITY

NEWSFLOW & CATALYSTS | NEAR TERM TO RESOURCE DEFINITION

	ACTIVITY & STATUS	KEY METRIC	WHAT'S NEXT
	**DRILLING & ASSAYS**	**2 rigs** active at Danvers	Infill and step-out drilling along the Teshierpi Fault Zone and the Danvers 1 northeast extension. First Bornite Hills assays expected October 2026
	**REGIONAL GEOPHYSICS** **OCCURING**	**>72km** of contact in survey	Sander Geophysics ultra high definition mag, gravity and radiometric survey over the sediments, Thor & Rocket, to rank 2027 drill targets
	**REGIONAL EXPLORATION** **UNDERWAY**	**~725m** Bornite Hills strike	Till sampling underway at Thor & Rocket. Survey data to be integrated with the Danvers exploration model, with Bornite Hills a clear follow-up target
	**PRODUCT PLANNING** **PLANNED**	**95.4%** peak Cu recovery to date	Further testwork on DSO and copper concentrate products, building on met results that confirmed a simple conventional flotation flowsheet
	**RESOURCES** **2027 & 2028**	**4** Danvers zones targeted	JORC Exploration Target and Maiden Resource Estimate targeted for Danvers 1 during 2027, with Danvers 2, 3 and 4 to follow during 2028

Timings are Company targets and subject to change. See ASX announcements dated 21 September 2026 "Bornite Hills Delivers Significant Copper Discovery at Rae"; 8 April 2026 "Excellent Met Results at Rae Deliver Plus 95% Cu Recovery"

COMPETENT PERSON STATEMENT

THE INFORMATION CONTAINED IN THIS PRESENTATION HAS BEEN PREPARED BY WHITE CLIFF MINERALS LIMITED (THE COMPANY).

The information in this report that relates to exploration results, mineral resources or ore reserves is based on information compiled by Eric Sondergaard, who is a member of The Association of Professional Engineers & Geoscientists of Alberta and the Northwest Territories & Nunavut Association of Professional Engineers & Geoscientists. Mr Sondergaard is an employee of White Cliff Minerals. Mr Sondergaard has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Sondergaard consents to the inclusion of this information in the form and context in which it appears in this report.

The historic resource estimate for the Licence, is a historic estimate and not in accordance with the JORC Code. The Company notes that the estimate and historic drilling results dated 1967 and 1968 are not reported in accordance with the NI 43-101 or JORC Code 2012. A competent person has not done sufficient work to disclose the estimate/results in accordance with the JORC Code 2012. It is possible that following further evaluation and/or exploration work that the confidence in the estimate and reported exploration results may be reduced when reported under the JORC Code 2012. Nothing has come to the attention of the Company that causes it to question the accuracy or reliability of the historical exploration results, but the Company has not independently validated the historical exploration results and therefore is not to be regarded as reporting, adopting or endorsing the historical exploration results.

Technical Annexures

DANVERS | REGIONAL STRUCTURE & DIAMOND DRILLING

A REGIONAL STRUCTURE WITH CLEAR COPPER ENDOWMENT

For personal use only

- The Teshierpi fault zones is a major regional structure, trending south west / north east - with clear copper endowment
- Drilling (both RC & Diamond) has targeted the magnetic lows - interpreted to represent the fluid pathway through the once magnetic basalts
- Diamond drilling has confirmed:
  - It is composed of different breccia types which control mineralisation
  - Copper mineralisation is present in different forms
  - A prospective horizon along the margins of the major fault exists – tied to a clear change in magnetic response
  - Permeability appears greatest on the transition into the major structure, like the edges of breccia pipes in a porphyry environment

Figure - *Photograph of NQ2 diameter core containing coarse grained chalcocite breccia cement from between 175.4-179.3m in downhole in DAN26036. Interval returned 3.90m @ 16.45% Cu and 31g/t Ag from 175.4m*

Figure - *Photograph of halved NQ2 diameter core showing mixed chalcocite and bornite mineralisation in the chlorite breccia zone at 45.5m in DAN26026*

DANVERS | KEY MINERALISATION STYLES

FOUR STYLES CONTROL COPPER DISTRIBUTION

For personal use only

- Crackle & Mosaic Breccias
  - Early formed breccias with only minor clast movement and disaggregation; chalcocite-bornite-chalcopyrite-calcite cement
- Sulphide Veining
  - Quartz veining with selvages of chalcocite, occupying brittle structures
- Disseminated Copper Sulphides
  - Pervasive appearance of bornite-chalcopyrite throughout the host rock
- Flow Top Replacement
  - Infilling of amygdules (volcanic gas pockets) with copper sulphides; flow tops offer increased permeability and porosity

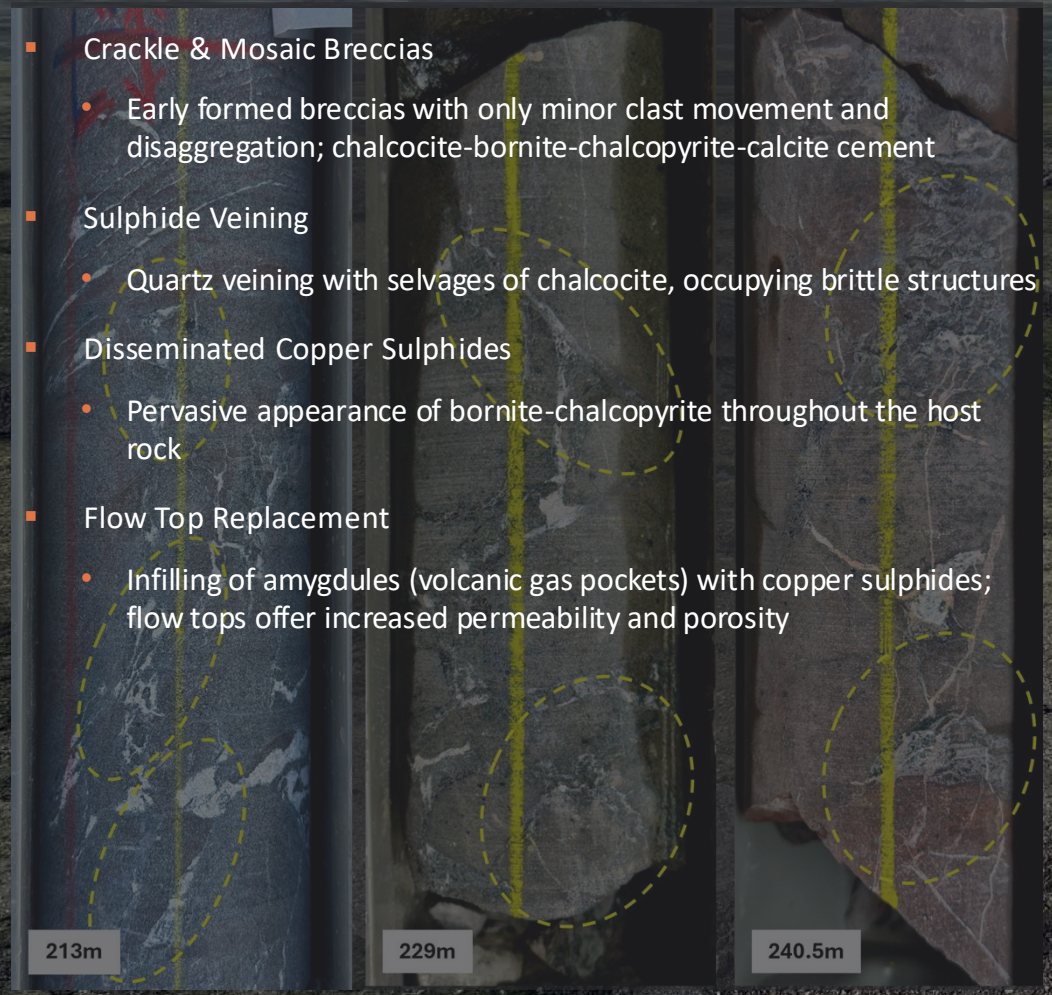

***Figure** - Danvers Copper Distribution*

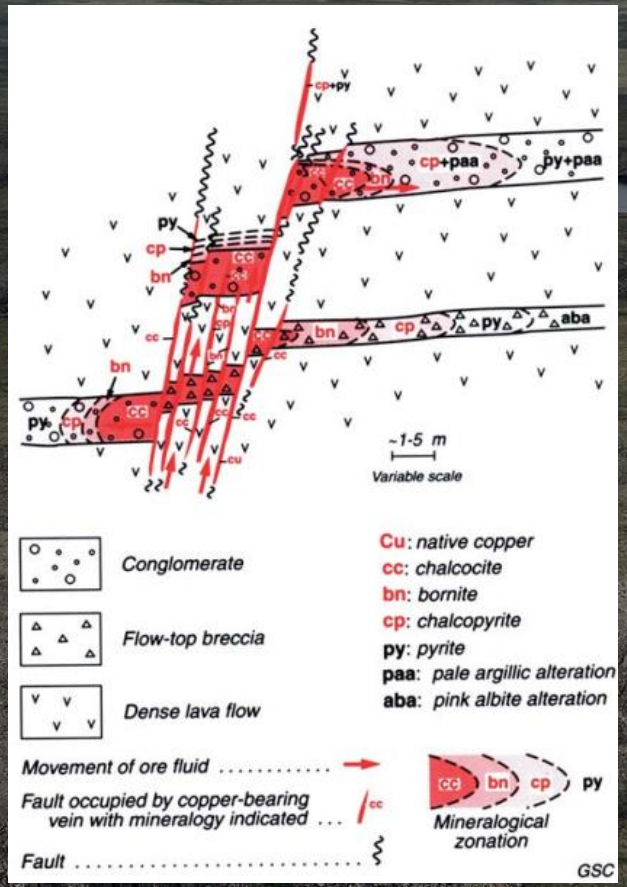

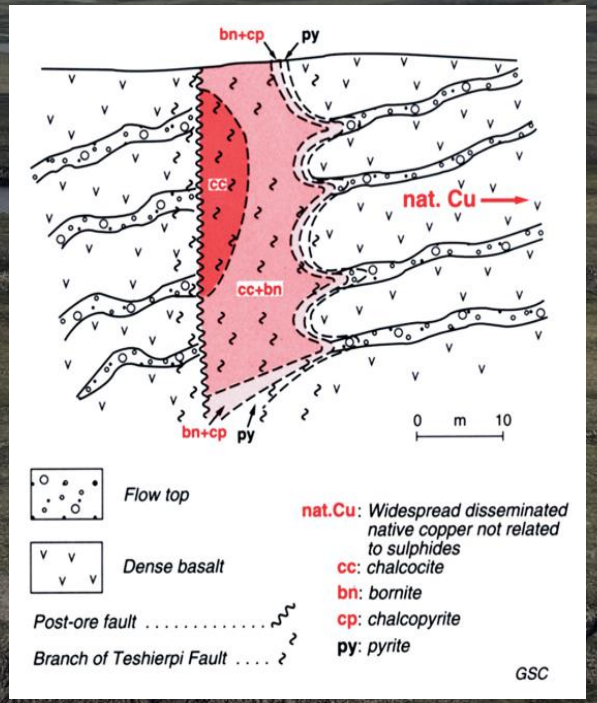

***Figure** - Danvers Breccia System*

DANVERS GEOLOGY

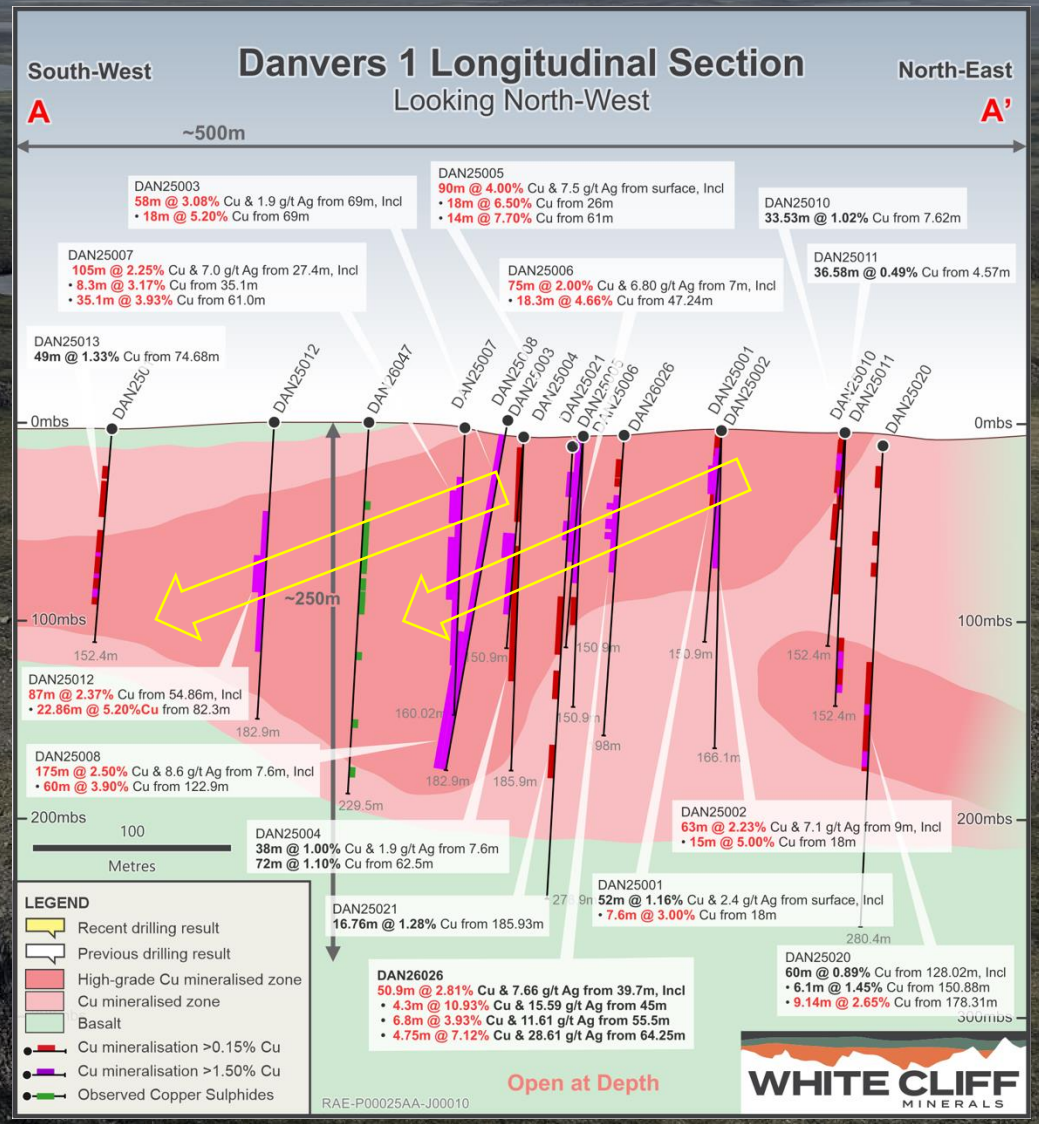

Diamond Drilling the Key to Unlocking Geological Model

For personal use only

Danvers 1 & Extensions

- Mineralisation at Danvers 1 is hosted within a chaotic breccia that is strongly chlorite altered and dominated by bornite and chalcocite with lesser chalcopyrite, forming high-grade intervals
- Copper sulphides are present as disseminations, sulphide veinlets, breccia cement and are locally associated with quartz-carbonate veining
- Copper grades extend beyond the principal breccia into basalt on both sides of the mineralised structure
- First diamond drilling at Danvers reveals a high-grade plunge (shallow dipping plunge to the south west) within the main breccia body
- Orientated core allows specific targeting of these high-grade intervals in follow-up drilling
- Highlights from first diamond drill assays (DAN26026) include:
  - 4.3m @ 10.93% Cu; and
  - 4.75m @ 7.12% Cu.
- Drillhole DAN26047 targets a high grade zone between 2025 drillholes, returning 42.19m of chalcocite-bornite dominant copper sulphides and confirming a high-grade plunging component

***Figure** - Long section of Danvers 1, with the Company's first diamond drill hole DAN26026 highlighted*

DANVERS GEOLOGY

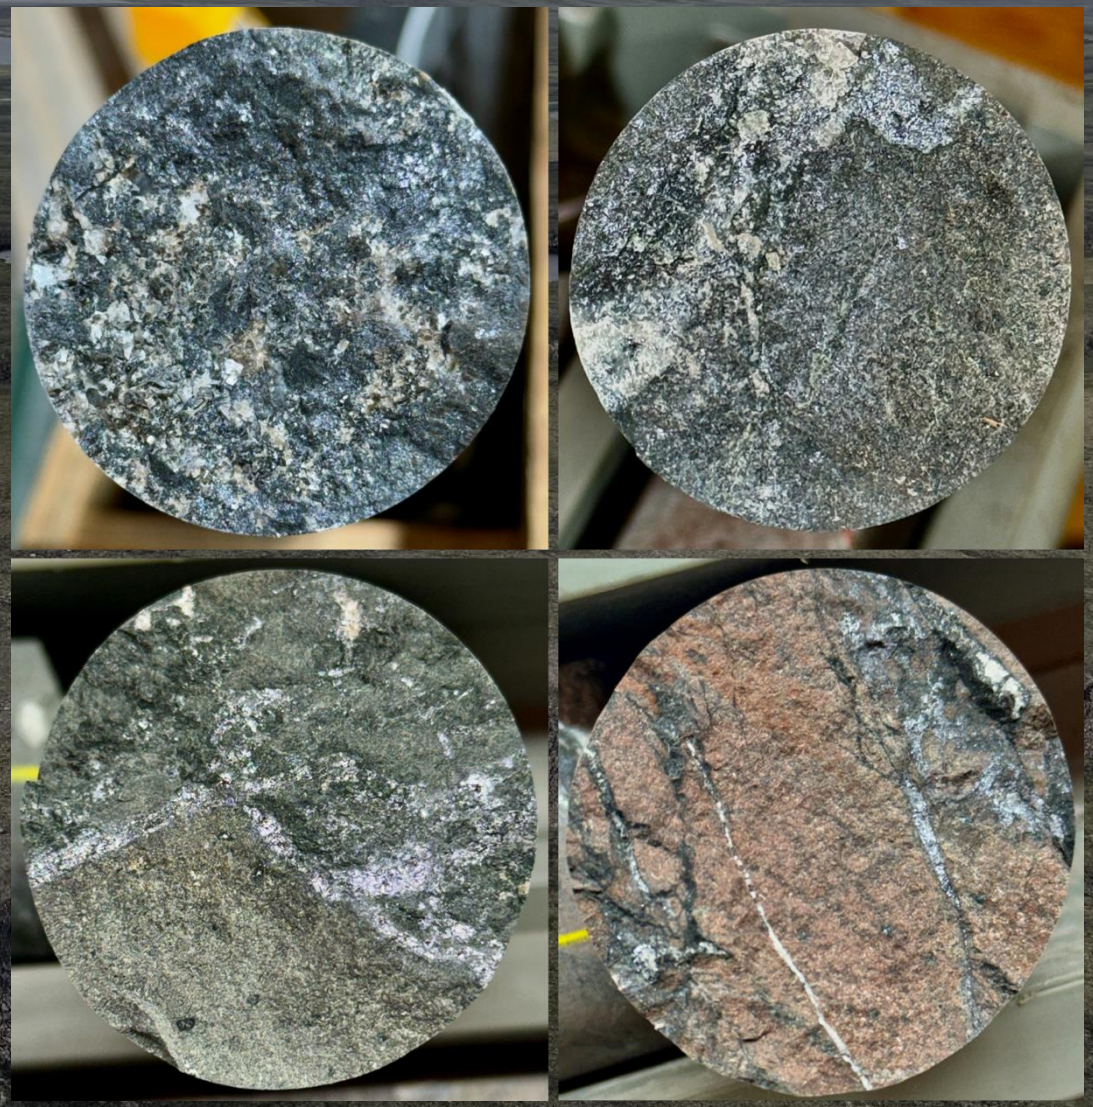

Diamond Drilling the Key to Unlocking Geological Model

For personal use only

Teshierpi Fault Zone

- Recent drilling continues to confirm the presence of chalcocite and bornite as the dominant copper sulphide minerals within the mineralised zones
- Mineralisation along the fault zone is associated with crackle and mosaic breccias, with chalcocite forming an important part of the breccia cement alongside calcite and chlorite
- Brecciation intensifies with movement into the main fault zone, with a chaotic breccia texture becoming dominant and strong, pervasive hematite alteration
- The ongoing identification of chalcocite and bornite is highly encouraging, as both minerals are associated with high-grade copper mineralisation and favourable metallurgical characteristics
- Chalcocite contains approximately 80% copper by weight, while bornite contains approximately 63% copper, making them among the most copper-rich sulphide minerals

Figure - *Photographs of NQ2 diameter diamond drill core. Clockwise from top left depths are 208m, 211m, 229.3m, 241.1m. Images show variably altered (chlorite and hematite) chalcocite bearing basalts. Chalcocite forming breccia cement and veinlets with calcite and chlorite.*

DANVERS DRILL TARGETING

ADVANCED GEOPHYSICS DRIVE TARGET GENERATION

>95% Drilling success rate - Hitting Cu mineralisation

- Latest generation airborne geophysics used - HeliTEM® helicopter time-domain AEM provided high-resolution earth conductivity imaging with enhanced sensitivity to conductive targets
- Perth based - Resource Potentials and Terra Resources were engaged to interpret the results, bringing world-class expertise in this style of copper mineralization
- The Danvers Copper Deposit is characterised by:
  - A linear low magnetic zone - structurally controlled demagnetisation of the host basalt, this magnetic low correlates with the main fault structure and target areas
  - An increased conductivity - X-component anomalism,
  - An induced polarisation effect - airborne EM IP anomalism, and
  - A northeast/southwest strike, paralleling the main Teshierpi Fault Zone.
- Elevated conductivity is noted along both the Teshierpi Fault and the southeastern parallel fault which is host to Danvers. There are peaks in conductivity forming targets for sulphide mineralisation
- Zones of particularly strong demagnetism are noted forming discrete zones within the large fault systems, offering targets where high fluid flow can be interpreted
- Drilling is directly targeting the causative structure, not just surface geochemistry
- **Direct similarities in magnetic response at other regional targets (Vision, Rocket, Thor)**

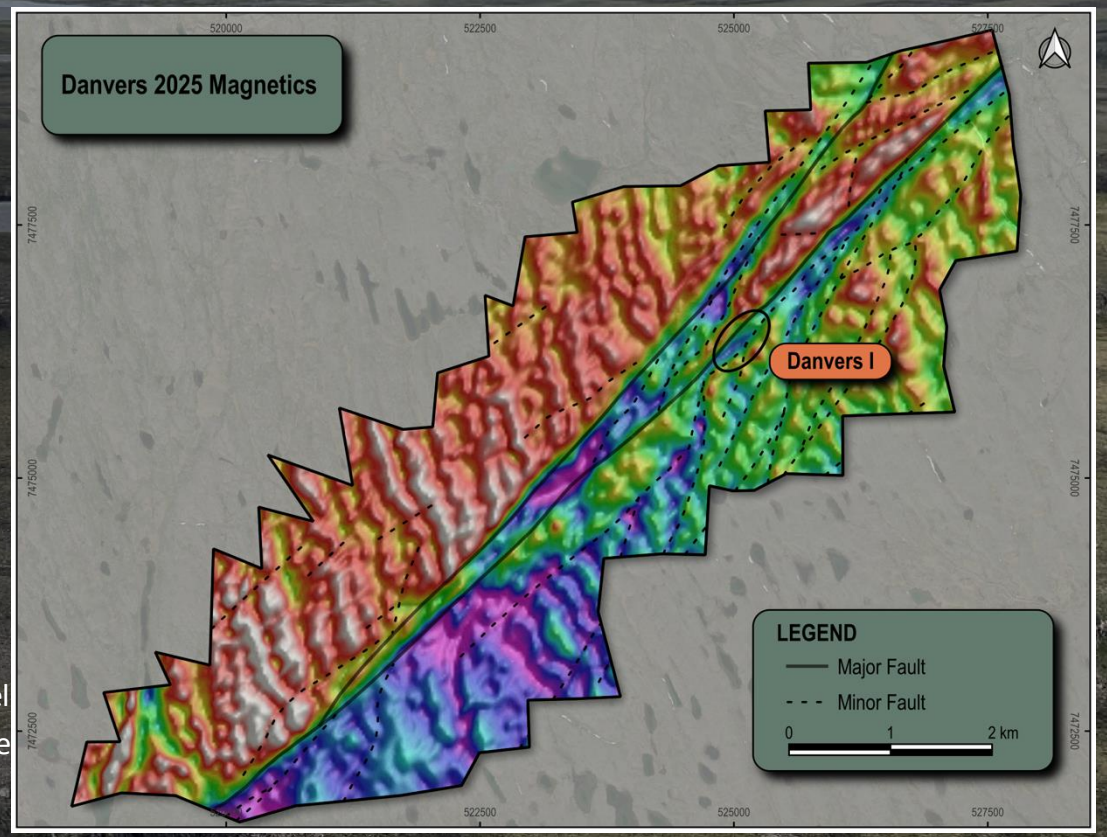

Figure - *Map of 2025 magnetic survey results at Danvers. Displayed as TMIRTP with a NE directed sun hillshade. White-red represents high magnetic response, vs. blue-purple for low magnetic response*

SEDIMENTARY COPPER | RAE DISTRICT

TRUE REGIONAL SCALE | THE GREATER RAE OPPORTUNITY

For personal use only

- Sediment Hosted Copper Systems - Drilling is targeting a laterally extensive, sheet-like, copper horizon where copper mineralisation is typically hosted within a vertically constrained interval ranging from approximately 2m to 30m thick
- One of the largest emerging sedimentary copper targets worldwide
- The Rae project area is similar in age, geology and formation to both the Central African Copperbelt and the European Permian Kupferschiefer - host to some of the largest- stratiform copper deposits in the world
- >75km of this upper Rae Group sedimentary horizon is controlled by White Cliff
- A further prospective sedimentary horizon with proven historic copper showings and sediment copper anomalies akin to Mt Gunson copper district in Australia

SEDIMENT HOSTED COPPER | FORMATION

ALL KEY REQUIREMENTS: 1. SOURCE ROCKS; 2 PATHWAYS & 3. HOST ROCKS

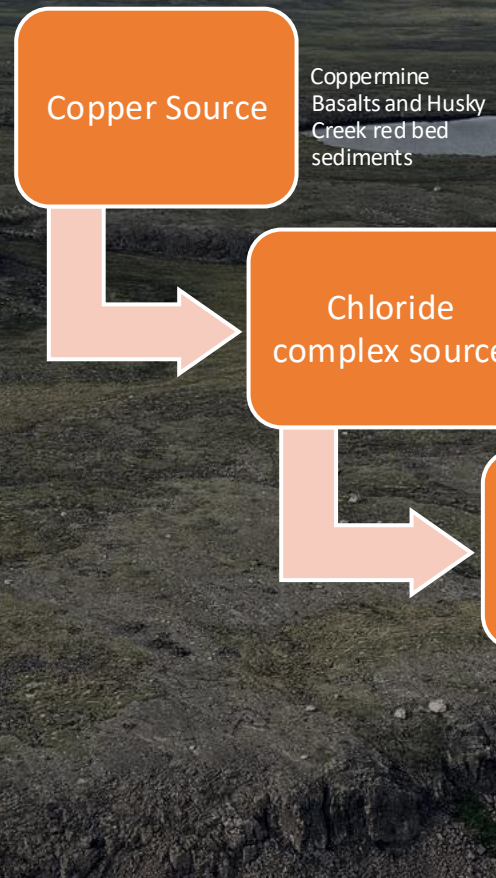

Rae Copper Project now proven host to all 1st order required controls for Sedimentary Copper - Identified at desktop study level & now drill confirmed

Style of Mineralisation

- Reduced facies sediment hosted copper
- Red-bed style sediment hosted copper

Stages of Deposit Formation

1. Metal Source: Red Bed Sandstones and volcanic rocks of the Coppermine River Group
2. Fluid Pathway: Regional and local faults such as the Herb Dixon Fault Zone
3. Redox Boundary: Contrast between oxidised red beds/basalt and reduced pyrite bearing lower Rae Group Sediments
4. Copper Mineralisation: A zonation of copper sulphides (Chalcopyrite-Bornite-Chalcocite)

Fertile structures - semi-massive chalcopyrite structures below Rae Group

Proven host rocks – reduced mudstones with chalcopyrite replacement
